The European Activation File: EAF-2003 decay data library

RA Forrest

EURATOM/UKAEA Fusion Association, Culham Science Centre,
Abingdon, Oxfordshire, OX14 3DB, UK.

Abstract

The European Activation System (EASY) includes, as the source of nuclear data, the European Activation File (EAF). A new version of EAF, EAF-2003, has been developed, and this report gives details of the EAF decay data library. The sources of data and the methods of assembly are described, but the bulk of the report is devoted to a listing of summary properties of all the 1917 nuclides contained in the library.

The summary properties listed are: nuclide spin, decay modes, half-life (with percentage error), mean decay energies and data source.

Introduction

The European Activation File (EAF) is a set of libraries of nuclear data that is designed as input to inventory codes (specifically FISPACT) to enable the activation of fusion devices to be calculated. The EAF effort was initially based at ECN Petten and grew from work over 1986 to 1989 on the REAC-ECN libraries 1 - 5 based on the American REAC library. It is important to note that at this time EAF referred only to the neutron-induced cross section library; further details and the history of this element of EAF is covered in the EAF Cross section library report [1]. Initial work in the UK on cross section libraries followed a parallel course with UKACT1 [2], which was also developed from the REAC library, UKACT1 was tailored as an input to FISPACT. To accompany this the decay data library UKDECAY1 [2] was developed based on JEF-1 evaluations, in the ENDF/B-5 format. The UKDECAY libraries continued to be developed to remain compatible with the EAF cross section libraries, but the description and documentation of these libraries remained sparse, as most effort was given to the documentation and development of the cross section libraries and the FISPACT inventory code.

With the release of EAF-4.1 in mid 1995, and the decision to move all activation library development to the EURATOM/UKAEA Fusion Association, the scope of the term EAF was enlarged to cover all the data libraries required as input to FISPACT. Thus the decay data library was termed EAF_DEC-4.1, and this is briefly described in the FISPACT 4 User Manual [3]. A full description of the decay data library was given as part of EASY-99 [4] and EASY-2001 [5], and the purpose of the current report is to update these reports for EASY-2003. This report is now seen as part of the complete documentation of the European Activation System (EASY) for the version released at the beginning of 2003 - EASY-2003 [6].

The report consists of a description of the composition of the library, which relies heavily on existing European evaluations, but also includes original, fusion-funded work to deal with deficiencies in the existing data. The method of compiling the decay library has been further improved by embedding it in the SAFEPAQ-II system [7] that enables more thorough auditing and quality assurance to be applied to library maintenance. Finally a list of each nuclide in EAF_DEC-2003, and a summary of their properties forms the major part of the report and acts as a convenient guide to the contents of the library. Similar information, but in a different format is available to FISPACT users in the **PRINTLIB** output, and the

recommendation, given in the FISPACT-2003 User manual [8], to use this output for reference still holds.

Data sources

The requirement of FISPACT for decay data is that every stable nuclide and every radionuclide that can be formed either directly by a reaction or as a decay daughter of an existing radionuclide needs to be identified (be included in the FISPACT index file) and to have information on half-life, decay modes, decay energies and, if possible, the γ spectrum. For EAF-2003 a total of 1917 nuclides are included, and for the majority the most comprehensive source of data is the set of evaluated files in JEF-2.2. This library of radioactive nuclides [9] was compiled by the NEA Data Bank based on the UK and French national libraries, supplemented by entries from the Evaluated Nuclear Structure Data File (ENSDF). The library is in ENDF/B-6 format (MF = 8, MT = 457) but its main deficiency is the lack of data for stable nuclides. FISPACT is able to read directly the ENDF/B-6 (and ENDF/B-5) formats, and although it does ‘process’ this in the sense of binning the γ spectrum data and storing the other data in internal arrays, there is no need for a separate file format that the ENDF/B format data needs to be converted into.

To overcome the lack of stable nuclides in JEF-2.2, a file for each stable nuclide was generated (MF = 1, MT = 451 format). Data identifying the nuclide can be entered in this format file, but because no MF = 8, MT = 457 file is possible under the existing ENDF rules it is not possible to include data on the spin and parity. The data for these stable nuclides are trivial (ZA and AWR are the main data) and are extracted from a source such as the Nuclear Wallet Cards [10]. The JEF library was compiled to satisfy the requirements of the nuclear industry, and so concentrates on nuclides relevant to fission power plants. Fusion activation studies require information on a broader range of nuclides and it is therefore found that there are gaps in the JEF-2.2 library. To fill these, standard printed data sources such as Browne and Firestone [11] and the Nuclear Wallet cards are used and converted into ENDF/B format. Using these standard sources there are still nuclides for which some of the required information is missing. In the last resort estimates of the missing quantities were made using the relationships shown below.

β^- decay: if $\langle\gamma\rangle$ not known, $\langle\gamma\rangle = Q_{\beta^-} / 3$ and $\langle\beta\rangle = Q_{\beta^-} / 3$
if $\langle\gamma\rangle$ known, $\langle\beta\rangle = (Q_{\beta^-} - \langle\gamma\rangle) / 2$

ϵ and β^+ decays: from neighbouring nuclides take typical value of f_β = fraction of decay that is β^+ , and define $e = (Q_\epsilon - 2m_e c^2) /$

2. Then $\langle\gamma\rangle = (1 - f_\beta) e$ and $\langle\beta\rangle = f_\beta e$. If $e < 0$ then assume $\langle\beta\rangle = 0$ and choose $\langle\gamma\rangle$ from available data.

α decay: $\langle\alpha\rangle$ = energy of alpha x branching fraction for α decay.

In these relationships the mean value of a quantity is shown by $\langle \cdot \rangle$, α , β , γ represent the alpha, beta and gamma energies and the Q-value for a decay is shown by Q .

During the use of previous decay data libraries it was noted that for some nuclides the average γ energy did not agree with the mean energy calculated from the γ spectrum data. In view of these deficiencies and the fact that some existing JEF evaluations do not contain any γ spectrum data, A. Nichols (previously with AEA Technology) has carried out new evaluations over the last six years. The nuclides that have been studied and that are included in EAF_DEC-2003 are given in Table 1. A description of the evaluation work is given in reference 12, the ENDF format files are stored in the libraries UKPADD-n ($n = 2, 3, 4, 5, 6, 6.1, 6.2, 6.3$) maintained by Serco (previously AEA Technology) [13,14]. These new files have been included in the UKPADD-6.3 library that is used within the UK and will form part of the input to the next version of JEF. UKPADD-6.3 contains all the evaluations made by Nichols for fusion, including ones from UKPADD-6.2 and other recent ones made for BNFL [15]. Differences between EAF_DEC-2001 and EAF_DEC-2003 are indicated in column 3.

Another source of evaluated files is the US decay data library assembled by F. Mann to accompany the REAC activation library [16]. In most instances these files are not significantly better than files generated from the standard sources for nuclides missing from JEF-2.2, but some of these files have been used during the compilation of EAF_DEC-2003.

An additional feature in FISPACT-97, i.e. inclusion of half-life uncertainties in uncertainty estimation of radiological quantities, placed a new requirement on the decay data library. It was necessary to ensure that the file for each nuclide contains a value for the half-life uncertainty. Many of the existing evaluations contain no value for this quantity, and it was necessary to enter this by hand using either the standard sources or using an estimated value (typically 50% uncertainty).

Another use of the decay data library is to generate a list of the spins and state energies of all isomeric states. This information is required by the SAFEPAQ-II processing code when the splitting of total cross sections between ground and isomeric states is calculated by systematics. The systematic formula requires the spins of both the ground and isomeric states, and to try and ensure consistency between the various EAF libraries these values are taken directly from the decay data library. In many instances the spin data are missing from the evaluations and standard sources were used to fill in the gaps.

The details of the compilation of the library are discussed in the next section, but it can be noted here that in all cases where corrections to the above sources were made, these were done on a copy of the file, not on the original file itself. The sources of data are shown in Table 2, which gives an identification number for each source that is used in the main nuclide listing.

Table 2. Data sources for EAF_DEC-2001

| Data source | Source number | Comments |
|---------------|---------------|-------------------------------------------------------------------------------------------------------|
| stables | 1 | Identification information for stable nuclides |
| ukpadd6.3 | 2 | Collection of recent evaluations by A. Nichols |
| culham_93 | 3 | New files from standard sources created in 1993 |
| culham_95 | 4 | New files from standard sources created in 1995 |
| culham_96 | 5 | New files from standard sources created in 1996 |
| culham_97 | 6 | Additions and amendments to existing files, or new files from standard sources created for EAF-97 |
| culham_98 | 7 | Additions and amendments to existing files, or new files from standard sources created for EAF-99 |
| culham_01 | 8 | Additions and amendments to existing files, (primarily to AWR) created for EAF-2001 |
| jef22_dec | 9 | JEF-2.2 library |
| jef22_dec_cul | 10 | Additions and amendments to JEF-2.2 files |
| usdecay_aug93 | 11 | US decay library dated August 1993 |
| ukhedd2.2 | 12 | Collection of evaluations (generally heavy nuclides) by A. Nichols, some have been adopted by JEF-2.2 |

Library processing

EAF-2003 library processing uses the SAFEPAQ-II code [7]. This has been developed from the SYMPAL [17] and SAFEPAQ [18] applications. In addition to the tasks related to cross section processing, the decay data library management is also handled by SAFEPAQ-II. Details of the use of SAFEPAQ-II for the decay data library processing are described in the User manual. Here only an outline of the processing is given.

The files of decay data are stored in separate folders on a hard disk. A list of all required nuclides with the source of data is constructed; this list is part of the Parameter database and using the interactive tools in SAFEPAQ-II nuclides can be added or deleted and data sources changed - there is no direct editing of the database to introduce errors. Each change is logged so that a record of when changes were made is automatically stored. When a new version of the decay data library is built, SAFEPAQ-II using the list of nuclides, copies the file for each nuclide from the specified source and produces the new library. In addition a database of decay properties is constructed that can be used in the subsequent cross section processing. The database can also be viewed in SAFEPAQ-II and is also used in

the EASY User Interface [8] so that users can view decay data. A new index of nuclides in the correct format for FISPACT and other data libraries are also generated during this processing phase. The list of nuclide information given in the next section was generated by SAFEPAQ-II from the Parameter database. By using tables in Parameter as the basic source of all decay data it is possible to ensure consistency between the various EAF libraries and FISPACT.

The library EAF_DEC-2003 is split into 10 sub-files for ease of handling, FISPACT expects them to be numbered *library_name.001 - library_name.010*. Only the final sub-file is terminated by the TEND line. The first sub-file contains an additional two header lines: the first contains an integer value of the number of header lines and the second a description of the library. FISPACT expects this header and it must be present on any decay library used as input. The nuclides at which the splitting into the 10 sub-files occurs is determined by SAFEPAQ-II by reading data from a Table in Parameter. This lists the nuclides that end each sub-file. These nuclides are shown in Table 3.

Table 3. Last nuclides in sub-files of EAF_DEC-2003.

| Sub-file | Last nuclide in sub-file |
|----------|--------------------------|
| 1 | Br- 86 |
| 2 | Ru-111 |
| 3 | Sn-131m |
| 4 | Cs-140 |
| 5 | Eu-160 |
| 6 | Tm-176 |
| 7 | Re-195 |
| 8 | Tl-210 |
| 9 | Ac-234 |

Library contents

The contents of EAF_DEC-2003 is listed below. Column 1 shows the ID of the nuclide as used in FISPACT, column 2 is the nuclide name, column 3 is the nuclide spin, column 4 shows the decay modes, column 5 is the nuclide half-life, column 6 the uncertainty in the half-life, column 7 is the heavy particle energy (mean α), column 8 is the light particle energy (mean β), column 9 is the photon energy (mean γ) and column 10 is the data source number. To aid readability zero values in columns 4 - 9 are replaced by blanks. The key to symbols is given at the end of the listing.

| ID | Nuclide | J | Decay modes | T½ | ΔT½ (%) | <α> (eV) | <β> (eV) | <γ> (eV) | Src |

Key to listing: Nuclide names may contain ‘m’ or ‘n’ following the mass number, these refer to 1st and 2nd isomeric states respectively. A nuclide spin (J) shown by ‘?’ means that it is unknown, the file actually contains -77.777. If no decay mode is given then the nuclide is stable, a single mode is labelled as beta - decay (β^-), beta + or electron capture decay (β^+), an isomeric transition (IT), alpha decay (α), proton decay (p) or neutron decay (n). Combinations of these are shown separated by a comma e.g. β^-,n is a beta - followed by neutron emission. If the daughter nuclide is not in the ground state then the decay symbol has the subscript ‘m’ or ‘n’; if it is required then the subscript ‘g’ distinguishes the daughter in the ground state. Multiple decay modes are separated by a semicolon; for each mode the branching ratio is given in percent. If the percentage branching is less than 0.01% then the symbol ‘~’ is used. The nuclide half-life (T½) is given in units of seconds (s), minutes (m), hours (h), days (d) or years (y); fixed format is used wherever possible, for very short- or long-lived nuclides scientific notation is applied.

Note that the nuclide ^{49}Fe is used in a special fashion by FISPACT. The nuclide is required to be stable and be totally unreactive: this pseudo-nuclide is shown in the listing, but in reality ^{49}Fe is very short lived (75 ms).
