## Abstract

In the European fusion programme, safety and environmental issues are of great importance in the continuing development of power plants. In support of this programme, a sound, complete and reliable neutron-induced cross section data library is required. The European Activation File (EAF) project has been an ongoing process performed through European and world-wide co-operation that has led to the creation of succeeding EAF versions. The latest release, EAF-2007, in a significant change from previous versions includes cross section data for deuteron- and proton-induced reactions. As with EAF-2005 all cross sections have an upper energy limit of 60 MeV. EAF-2007 has benefited from the generation and maintenance of comprehensive activation files and the development of the processing code SAFEPQAQ-II. Cross section validation exercises against both experimental data and systematics, which were started on the EAF-4 file (1995), enable a comprehensive assessment of the data. SAFEPQAQ-II is used to apply a series of modifications to the original source data. A very important set of modifications concerns renormalisation and branching using experimental or systematic data. A total of 8,276 reactions have been so changed; 12% of all the reactions. These are challenging tasks when the source contains non-threshold reactions with an energy dependent branching ratio. Although EAF-2007 is the best-validated cross section library in the world, currently less than 3% of all the reactions can be compared with experimental information, and sometimes then only for very limited, and not always fusion relevant, energy ranges.

As with EAF-2001, -2003 and -2005, results of integral experiments have been used to correct, adjust and validate data. This can be done using SAFEPQAQ-II by inputting the measured effective cross sections. Validation using integral data has been performed by means of direct comparison with measurements of various materials under fusion-relevant neutron spectra. Irradiations have been carried out at ENEA FNG, FZK Isochron-cyclotron, Serгиеv Posad SNEG-13, TUD, Řež and JAERI FNS and integral C/E comparisons made (C/E is the ratio of the library to the experimental value). In addition available data from the literature, particularly for neutrons above 20 MeV have been collected and used. The results of these benchmarking exercises have indicated, in conjunction with differential data, where modifications to the data can be applied.

The EAF-2007 library contains 65,565 excitation functions involving 816 different targets from  $^1\text{H}$  to  $^{257}\text{Fm}$ , atomic numbers 1 to 100, in the energy range  $10^{-5}$  eV to 60 MeV. The 3,591,351 lines that make up the point-wise file are then processed into numerous group-wise files with different micro-flux weighting spectra to meet various user needs. Uniquely, an uncertainty file is also provided that quantifies the degree of confidence placed on the data for each reaction channel.

## Introduction

The European Activation File (EAF) is the collection of nuclear data that is required to carry out inventory calculations of materials that have been activated following exposure to neutrons or charged particles. Along with the inventory code FISPACT [1], EAF comprises the European Activation System (EASY) which has been developed for fusion activation studies.

One of the components of EAF is the collection of neutron-induced cross section data. The present report documents this cross section library, detailing how the library has been developed over a twenty-one year period, describing the methodology employed for its production and testing and providing an index of all the reactions. The present report forms part of the documentation for EASY, other reports cover the FISPACT code [1], SAFEP AQ-II [2] and other components of EAF [3,4,5,6].

The current release of the European Activation File, EAF-2007, contains cross section data of neutron-induced reactions for energies between  $10^{-5}$  eV and 60 MeV. This report covers all the reactions. The library contains data for targets up to and including fermium ( $Z=100$ ). A new version of the library has been produced by the SAFEP AQ-II tool, which uses data from various sources and applies a series of modifications. The choice of data sources and the basis of the modifications use the knowledge derived from previous EAF libraries as a starter. For EAF-2007 this starter knowledge was taken both from the EAF-2005 file [7] and from the maintenance release EAF-2005.1 [8]. This is the fifth time that SAFEP AQ-II has been used for library development rather than the SYMPAL/SAFEP AQ tools [9,10,11] that were used for versions previous to 2001. Use of SAFEP AQ-II has enabled the efficient and comprehensive development of the new library.

The new version contains the results of a sustained effort from many laboratories and physicists world-wide. In common with the EAF-2005 library, the current library has an upper energy limit of the data at 60 MeV. Some 41 new targets have been added, and the file is somewhat larger than EAF-2005. The point-wise library has increased from 254 Mb to 264 MB and has also gained considerably in quality and completeness. The experimental database has been improved, particularly for data above 20 MeV. The wide range of available integral data has been used to improve the library, although this action will continue over the next year with the planned validation exercise on EAF-2007.

EAF-2007 contains data for 99 elements from H to Fm, but excludes data for the short-lived radioactive element Fr. There are 816 target isotopes, including ground, first and second isomers, which have non-zero cross sections (*i.e.* greater than  $10^{-8}$  b) below an energy of 60 MeV. Cross sections to and from isomeric states are listed separately in a point-wise ENDF File 3 section format. This leads to a total of 65,565 reaction channels that contain data. During the creation of the library several checks were made to monitor the quality of the data. The procedures employed, forming a part of SAFEPAQ-II, are fully described in reference 2 and are summarised in Figure 1. The entire process is handled in an interactive fashion allowing new data to be input, existing data to be examined in graphical and tabular modes, modifications to be defined and validation carried out. All changes to data are automatically logged and this forms part of the quality assurance (QA) of the library.

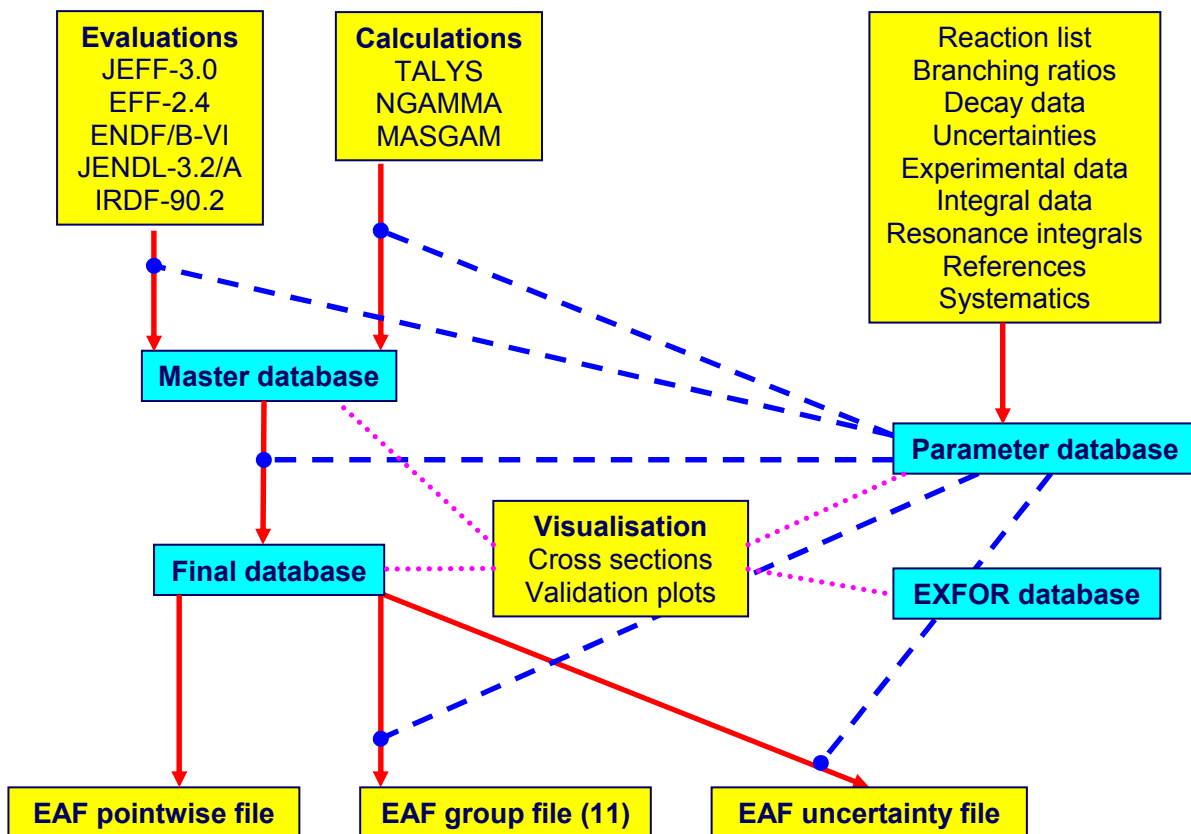

Figure 1. Flowchart of the SAFEPAQ-II processes. The arrows indicate flows of data, the dashed lines indicate that information in Parameter is required in the conversion and dotted lines show sources of data for visualisation.

## Historical survey

EAF-2007 is the latest result of a large amount of work on activation data carried out world-wide. The present section puts it in its

historical context, and enables references to some of this earlier work to be given. It is interesting that if we look back over the last 27 years and survey the questions that were being addressed by the fusion community about activation of materials in fusion devices and the tools available to give answers, it is evident that while the tools are much more extensive and sophisticated, many of the concerns are rather similar.

In the UK, the data library available for activation libraries was UKCTR11A, while the inventory code used was ORIGEN [12].

UKCTR11A was produced by Jarvis [13] from the earlier UKCTR11 [14]; both these libraries were designed for fusion activation calculations. UKCTR11A was a multi-group library (100 group GAM-II) that covered the energy range thermal - 15 MeV. It contained 1,477 reactions on 305 targets (note that U and Pu isotopes were included), some of which were radioactive (all radionuclides with  $T_{1/2} > 10$  days were considered as targets). It covered only 10 reaction types, ((n,2p) and (n,n't) are the 'low-energy' reaction types missing). Reference 13 describes the data sources for the library, and while much of the library was from experimentally based sources, nearly 500 reactions were calculated by the simple model code THRESH [15]. The library contained isomeric states as daughters, but no long-lived isomeric states were included as targets.

In the early 1980s, ECN Petten<sup>†</sup> (Netherlands) was involved in work, in collaboration with JRC Ispra, on the nuclear data needs for fusion activation. Collaboration between ECN and UKAEA lead to a new library UKCTR11-AR2 [16] which contained renormalisation of a large number of the UKCTR11A cross sections to experimental data at 14.5 MeV [17] or to systematics. This library was used for a series of activation calculations, but it was recognised that it was far from complete (many stable nuclides were missing, and the radionuclides considered as targets was limited), based on simple model calculations and lacked a proper treatment of isomeric states.

In 1985 Mann *et al.* produced a new activation library - REAC [18]. This substantially increased the number of reactions to about 6,000 (although the number of targets remained at about 300). This US library was made available to ECN Petten (there was a tripartite collaboration between ECN, UKAEA and Hanford, starting in about 1986, which involved sharing of data libraries). It should be noted that REAC was a point-wise library and that the data extended to 40 MeV. Another important difference from UKCTR11A was that reactions such as (n,t) and (n,n'd) which produce the same daughter nuclide were not lumped together. This is important if accurate calculations of gas production are to be carried out.

---

<sup>†</sup> The current name is NRG Petten.

Library development was continued at ECN by the process of renormalisation of REAC and the addition of data for radioactive targets. The new library was named REAC-ECN-1 [19]. The main features of REAC-ECN-1 were:

- An additional comment line was included in REAC-ECN-1. Note that REAC had a single comment line; apart from these lines both files are in ENDF/B-5, MF=3 format. The MT reaction identifiers are adopted except that for production of isomeric states, 300 (for m) or 600 (for n) are added.
- The GAM-II group format file GREAC-ECN-1 is similar to that of UKCTR11A except for the addition of the two comment lines. There are additional reactions so the ENDF MT numbers have been adopted, and then multiplied by 10 and the state value of the daughter added.
- The aim was to include all radionuclides with  $T_{1/2} > 1$  day as targets, in fact all the isomeric targets and a few ground state targets were missing.
- Data values at 14.5 MeV were compared with available experimental data, and renormalized if necessary.
- The branching ratios at 14.5 MeV were checked and if no reliable experimental data were available, the branching ratio was set to 0.5.
- Systematics at 14.5 MeV were taken from Qaim [20] and Kumabe and Fukuda [21]. These were used to renormalize the data from model calculations.

Further work followed at ECN leading to the release of REAC-ECN-2 [22]. This corrected some errors and introduced new systematics. The main features are:

- The systematics of Forrest [23] were adopted for production of charged daughters.
- The isomeric branching ratio was changed from 0.5 to a value determined by systematic formulae [24,25] that depend on the isomeric state spin of the daughter nuclide. Only in the case of (n, $\gamma$ ) reactions did the general value of 0.5 remain.
- Isomeric targets were included; these had the same cross sections as for the ground state.
- Some additional data sources were used for checking and renormalisation at 14.5 MeV.

The next library release by ECN was REAC-ECN-3 [26]. This contained 8,466 reactions in the energy range thermal to 20 MeV. Its main features were:

- Checking and improvement of 51 important reactions which produce long-lived radionuclides.
- Addition of 6 short-lived isotopes.

At about the same time a new library, UKACT1 [27,28], was produced by UKAEA. This was based on the same REAC library, but was only available in the GAM-II group structure. It used as a starter file GREAC-ECN-1, to which were added more targets (using THRESH) so that all radionuclides with  $T_{1/2} > 1$  day had data (in addition 34 nuclides with shorter half-life were included where a product formed by a single reaction is an important long-lived nuclide). Some features were:

- It included 49 first isomers and 4 second isomers as targets, and included all isomeric daughters with  $T_{1/2} > 1$ s.
- All targets included capture reactions (although for some radionuclides these were estimated).
- Superelastic collisions were included (these refer to (n,n') reactions from an isomeric state to the ground state).
- Checks were made to ensure that none of the standard reactions from each target were missing.
- UKACT1 contained 8,719 reactions on 625 targets.

By 1989 it was realised that it was unnecessary for such parallel library development at ECN and UKAEA to occur, so it was agreed that UKAEA would maintain the decay data library and the inventory code FISPACT, and that ECN would maintain the cross section library. UKAEA would continue to contribute to cross section development, but pass all data to ECN who would supply group libraries to UKAEA. By such collaboration an activation 'package' was developed.

This strategy led to the starter file for the European Activation File (EAF-0) [29], although it is also referred to as REAC-ECN-4 in some ECN reports. Note that this was also the first library that was assembled by the SYMPAL processing code (albeit an early version of SYMPAL with few of the features found in the final version [10]). The main improvements in EAF-0 over REAC-ECN-3 were:

- Addition of reactions on 142 targets (many of them isomers); isomeric targets had thresholds correctly different from ground state target. All targets with  $T_{1/2} > 1$  day included, giving 10,787 reactions.
- (n,n') reactions improved.
- (n,3n) cross sections near threshold adjusted.
- Renormalisation at 14.5 MeV improved.

EAF-1 (REAC-ECN-5) [30], was the first of the EAF series to be widely used in activation calculations following its release in March 1990. A clear statement of the EAF strategy is contained in a paper presented in late 1989 [31], the main points are:

1. Address the completeness of the library using the existing tools.
2. Provide the library with a simple but complete uncertainty file.
3. Carry out uncertainty estimation and sensitivity studies which will provide feedback on the quality of important reactions.
4. Wherever possible, improve the quality in general using more advanced model codes.

The main features of EAF-1 were:

- The number of targets was increased by demanding that all radionuclides with  $T_{1/2} > 0.5$  day had data.
- Improvement of low-energy data, particularly for the  $(n,\gamma)$  and  $(n,n')$  reactions.
- Inclusion of a provisional uncertainty file for important reactions covering the energy range thermal to 20 MeV.
- Use of more high quality evaluated files (*e.g.* from the JEF libraries).
- Special evaluations for 101 important reactions [31] to both long- and short-lived nuclides included.

The main emphasis for EAF-2 [32,33,34], which was released in May 1991, was to carry forward the EAF-1 improvements with special emphasis on the  $(n,\gamma)$  reactions. The main features were:

- 11,855 reactions on 699 targets.
- Use of some data from the international dosimetry file IRDF-90.
- Use of error factors derived from systematics [23] to assess the uncertainties for most of the reactions.
- Use of new data for renormalisation at 14.5 MeV.
- Group libraries in both GAM-II (100 groups) and VITAMIN-J (175 groups).

EAF-3 [35,36] was released in May 1992, the main features were:

- 12,899 reactions on 729 targets.
- Addition of 60 targets in the actinide range (At - Cm), the cross section data including the fission channel.

- Uncertainty file for all reactions in a 1 group (threshold reactions) and 2 groups (non-threshold reactions) structure.
- (n,p) and (n, $\alpha$ ) reactions with positive  $Q$ -values were inspected and revised in the thermal region.
- (n,2p) reactions calculated by THRESH were inspected and revised in the 14.5 MeV region.
- Use of more evaluated data (from EFF-2, ENDF/B-VI and JEF-2).
- Improvements in the (n, $\gamma$ ) data [37,38], including addition of the pre-equilibrium component at high energies if absent.
- Use of energy dependent isomeric branching ratios for (n, $\gamma$ ) reactions.
- Check of EAF values with experimental data at three energies (0.0253 eV, 30 keV and 14.5 MeV).

EAF-3.1 was released in mid 1993; apart from the correction of minor errors the cross section library remained the same as EAF-3, the major change was in the uncertainty file [39]. This was substantially improved, but the format remained the same.

EAF-4 [40] was released in March 1995, its main features were:

- 13,096 reactions on 734 targets.
- Addition of 25 higher actinide targets (Ra - Fm).
- Replacement of many of the data generated by THRESH with either new evaluations or superior calculations.
- Improvement of the capture reactions, especially the energy dependent isomer ratio.
- Additional comparison and renormalisation to experimental data at 14.5 MeV.
- Branching ratio systematics were improved for threshold reactions.
- Use of all available evaluated data from EFF-2.4, IRDF-90, JEF-2.2, ENDF/B-VI and JENDL-3 libraries. Use of data from the activation file ADL-3 [41].
- Special care was taken with the reactions identified as particularly important for the ITER project [42].
- The uncertainty file contained more information for (n, $\gamma$ ) and (n,f) reactions. These were given in three groups rather than the two groups used previously. More experimental uncertainties were used to replace the generic values adopted from systematics.
- The group-wise library was made available in two additional group structures - WIMS (69 groups) and XMAS (172 groups).

- The ability to calculate sequential charged particle reactions in FISPACT was due to new EAF libraries developed at FZK. See the FISPACT-2007 user manual [1] for details of these libraries.

EAF-4.1 [43] was released in June 1995. This version was the last processed at ECN Petten. It corrected various errors introduced into EAF-4.0 during processing. EAF-4.1 contained 12,976 reactions on 736 targets. Note that for distribution to users only the group-wise libraries are released, these only contained data for targets H - Cm, the higher actinide data only appearing in the point-wise library.

Work over the period 1995-1996 was devoted to the installation of SYMPAL at UKAEA and the further development of SYMPAL, SAFEPAQ and EAF that enabled the production of the IAEA FENDL/A-2.0 [44] library.

EAF-97 [45] was released in the summer of 1997. It contained data for 12,469 reactions on 766 targets. Many new data sources and experimental data [46,47,48,49,50,51,52,53,54] were used in its production. Special emphasis was put on improving the actinide data and the capture data [55]. However, erroneous interpolation laws were spotted when comparing plots of ENDF against PENDF and point-wise data against group-wise files [56]. It was decided to modify EAF-97 to correct the interpolation laws and EAF-97.1 was produced in January 1998. The corrections led to the modification of the interpolation law for 353 reaction channels in the point-wise file.

During the period 1998 - 1999, extensive data validation work was carried out. This contributed to the release of EAF-99 [57] at the beginning of 1999. It contained 12,468 reactions on 766 targets and while covering the same reactions as EAF-97.1 benefited from the large amount of integral data generated as part of the European Fusion Technology programme. About 750 reactions were significantly modified based on the integral data and experimental data from EXFOR. New data sources that were available include the Russian dosimetry file (RRDF) and helium production library (HEPRL-96) [58], individual evaluations from IRK Vienna [59] and data corrections from LANL [60].

General improvements in the  $1/v$  region for non-threshold reactions, additional calculations using NGAMMA, review of the (n,f) reactions and improvement of the uncertainty file were also areas of improvement in EAF-99.

Beginning in 1998 work started on the development of a new data evaluation and processing tool. This was designed to replace SYMPAL and SAFEPAQ and to use modern computer technology. SAFEPAQ-II [61] was designed from scratch using relational databases and interactive graphics. It runs on the various Windows operating systems and thus has the advantage of portability (it has

been installed at JUKO Research and CEA Cadarache) and of an automatic logging system that enables good quality assurance (QA) to be achieved. It is based on the ideas of SYMPAL and SAFEPAQ, but extends them and makes them more robust. A stable version was available in 2000 and it was used in the production of EAF-2001.

EAF-2001 [62,63] was produced in March 2001, although a maintenance release was also distributed in December 2001. It contained 12,470 reactions on 766 targets and benefited from the large amount of integral data generated as part of the European Fusion Technology programme. About 135 reactions were significantly modified based on the integral data and experimental data from EXFOR. New data sources that were available include the IRK evaluations of  $^{58}\text{Ni}$  [64] and  $^{60}\text{Ni}$  [65] and calculations by Mengoni [66] on light nuclides. A new systematic for  $(n,\gamma)$  at 30 keV was used. The use of integral data to improve the activation libraries was becoming increasingly important. EAF-2001 was the first to have a formal validation report [67,68] bringing together all the currently available integral data in the form of effective cross sections and comparing these with the library values.

New data sources, experimental and integral data were all incorporated in SAFEPAQ-II and the system was developed and tested further during 2001-2002; the outcome of this work, in respect of the neutron-induced cross section library, was the release of EAF-2003 [69]. It contained 12,617 reactions on 774 targets, and the most significant improvement resulted from the comparison of integral data with EAF-2001 [67]. A new systematic for  $(n,n'\alpha)$  was used [67], an improvement on the approximation used in earlier libraries. Several new data sources [70,71,72,73,74] were available for data selection. Considerable effort was spent on the  $(n,\gamma)$  channel, including the representation of missing resonances by the Single Resonance Approximation (SRA) [2] for about 80 reactions. Reactions on actinide targets was another area of improvement, including SRA for  $(n,f)$  reactions on five targets and changes of data source. About 77% of the actinide target reactions were modified using SAFEPAQ-II. Another innovation for EAF-2003 was a Quality score for each reaction indicating the experimental support for the reaction due to both differential and integral data.

Although the EAF format is very convenient for use in activation codes such as FISPACT, there are advantages to having data in a standard ENDF format. To answer this need EAF-2003 was converted to ENDF format and in this format was also adopted as the activation file for JEFF-3 [75]. The reasons for the conversion into ENDF-6 format are threefold. First, it significantly enhances the JEFF-3 release by the addition of an activation file. Second to considerably increase its usage by using a recognized, official file format, allowing use of existing processing codes and third to move towards a

universal nuclear data file in contrast to the current separate general and special purpose files. The format chosen for the JEFF-3.0/A file uses reaction cross sections (MF-3), cross sections (MF-10) and multiplicities (MF-9). Having the data in ENDF-6 format allows the ENDF suite of utilities and checker codes to be used alongside many other utility, visualizing and processing codes. By the change of format the scope of application is widened from fusion to include fission, dosimetry, inventories, depletion-transmutation and geophysics. The next step is to include the EAF uncertainty data for all channels into JEFF-3.0/A

All EAF libraries up to EAF-2003 have data in the energy range up to 20 MeV. This value is sufficient for activation calculations in fusion devices, but an increasingly important concern is the design of the IFMIF materials test facility. IFMIF [76] is an accelerator-based d-Li neutron source that will give a neutron spectrum with a high-energy tail up to about 55 MeV. In order to include such high energy neutrons in activation calculations it was necessary to extend the energy range of the EAF libraries. This is a major task, and prior to the production of the EAF-2005 library, there was a test library, EAF-2004 [77], produced to demonstrate the various methods, that was not distributed to users. Further information on this 'proof-of-principal' library is available in reference 78.

EAF-2005 [79,80] was released at the beginning of 2005. As mentioned above it was a significantly larger file than previously as the pointwise data extended to 60 MeV (and the groupwise data to 55 MeV). It contains data for 62,637 reactions on 775 targets. The library size is 254 MB (compared to 128 MB for EAF-2003). It had been demonstrated in the production of the EAF-2004 test file that it was feasible to retain the existing EAF methodology. Specifically reactions continued to be described by MT numbers rather than the production of various amounts of daughter nuclides. Additional (non ENDF standard) MT values were defined with the consequence that 86 reaction types were used in EAF-2005 compared to the 23 previously.

For reactions present in EAF-2003 it was decided to extend the data by using data generated by the TALYS model code [81] by A. Koning with global parameters. SAFEPAQ-II did this task automatically, renormalizing the high energy data so that it fitted smoothly on to the EAF-2003 data at 20 MeV. In some cases the necessary data were not available from TALYS, in which case other data were used. Secondly, reactions not present in EAF-2003 but with threshold below 60 MeV and values above a minimum (1  $\mu$ b) were added to the reaction list. Another consequence of the extended energy was the need to extend the number of uncertainty groups so that non-threshold reactions had four while threshold reactions had one or two depending on the threshold energy.

A number of new data sources were available:

- Evaluations by the CEA Bruyere le Chatel on Eu [82] and Rh [83] isotopes,  $^{151}\text{Sm}$  and  $^{238}\text{U}$  [84].
- The latest release of the US library, ENDF-B/VI release 8.
- The preliminary release of the US library, ENDF-B/VII.
- The intermediate energy library IEAF-2001 [85].
- The European JEFF-3.0 library [86].
- Maslov data for actinides [87].
- Calculations by V. Avrigeanu *et al.* for Mo isotopes [88].
- The calculated library NRG-2003 prepared using TALYS [89].
- The calculated library TALYS-5 prepared by A.J. Koning covering the same range of targets as EAF.

The fivefold increase in the number of reactions meant that it was inevitable that some errors were present in EAF-2005. These become apparent during the integral validation and after investigation with the new method of statistical analysis of cross sections (SACS) which is described in detail in a later section. Consequently data for 250 reactions were changed and a maintenance release, EAF-2005.1 [8] was distributed at the beginning of 2006. This also contained a preliminary deuteron-induced cross section library [90].

Further discussion of the methods used to extend the libraries is given in later sections. These extensions, new data source and experimental data resulted in the EAF-2007 library described in this report.

## Calculational tools

The preferred source of cross section data is one of the evaluated files. However, for many nuclides (especially radioactive ones) no such source is available and cross sections must be calculated. The code THRESH [15] has been mentioned in the previous section and this was widely used in earlier versions. Another simple model code, suitable for mass-production runs, EXIFON [91], has been also used in earlier EAF versions for the threshold reactions  $(n,2n)$ ,  $(n,3n)$ ,  $(n,p)$  and  $(n,\alpha)$ . Both codes are however, very unsophisticated and a wider range of tools are now preferred. In fact only one reaction remains from EXIFON, the rest have been changed in EAF-2007 to use data calculated with the TALYS code.

Many of the older neutron-capture codes (FISPRO, MASGAM [92], MASGAM+SIG-ECN and NGAMMA [93]) are still applicable and results from them still used for some for  $(n,\gamma)$  reactions. NGAMMA was used for many reactions in EAF-2001, -2003 and -2005 and is still used for some reactions in EAF-2007, although as improvements are made to the data TALYS data are being increasingly used. The NGAMMA code is described below for completeness.

Two approximations applied in the low energy resonance region for reactions with no threshold (such as (n, $\gamma$ ), (n,f), (n,p) and (n, $\alpha$ )) are outlined below. The Single Reaction Approximation (SRA) is described in Appendix 5 of the SAFEPAQ-II manual [2]; its ability to describe resonance integrals is demonstrated below. The Low Energy Approximation (LEA), used for (n,p) and (n, $\alpha$ ) reactions is also described.

The main calculational tool now is the code TALYS [81], which was first used to a limited extent for EAF-2003, but which has become of major importance for the new high-energy data above 20 MeV. For EAF-2007 the results of global calculations with TALYS code, labelled as the TALYS-6 and TALYS-6a data sources, have been used by default for all threshold reactions where there are no experimental data below 20 MeV. For such reactions renormalisation to systematics is only applied for a limited number of (n,p) and (n, $\alpha$ ) reactions. As noted above data from these sources are used to provide data for all reactions with thresholds above 20 MeV. The TALYS code is also described below.

## NGAMMA

NGAMMA is based on the spherical optical model, the Hauser-Feshbach formula with width fluctuation correction, the exciton model [94] and the unified model [95] in which equilibrium and pre-equilibrium emission mechanisms are unified and angular momentum conservation is taken into account. This exact treatment of pre-equilibrium processes replaces the approximation by systematics as applied in MASGAM. Besides the radiative capture channel the code also handles the competing particle emissions, including neutrons, protons and alphas. The possibility to renormalize the calculation to experimental data or to systematics is maintained.

The main input parameters are:

- **E1, M1 and E2 strength function models and giant resonance parameters.** The generalized Lorentzian formulation [96] has been adopted for the E1 resonance, except for deformed nuclei in the mass range above  $A = 150$ , for which the classical Lorentzian was used (based on conclusions in references 97 and 98). The giant E1 resonance parameters have been taken from a recent report [99] and checked against the very recent compilation of Varlamov [100]. If the experimental data on the E1 giant resonance were missing, the value from the neighbouring target has been extrapolated. The spin-flip M1 resonance has been adopted for M1 radiation with the standard parameterization [96], the cross section  $\sigma_0$  has been renormalized against the systematics (for details see reference 93). The single-particle model is used for E2 radiation.

- **Optical model.** Standard global neutron optical model parameters of Moldauer [101], Wilmore-Hodgson [101], Buck-Perey [102,103] and Uhl [104] have been tested on several nuclei ranging from  $A = 90 - 205$  and the parameters of Uhl, giving the best results, were finally adopted for calculations.
- **Discrete levels and level density.** Discrete levels have been taken from corresponding compilations published in Nuclear Data Sheets. The newly evaluated set of BSFG (back shifted Fermi gas) level density model parameters of the Beijing group (recommended by the IAEA RIPL/CRP) [105,106] have been used. In cases where no data were available, an extrapolated estimate from systematics was applied.

## SRA

The Single Resonance Approximation was introduced in EAF-2003. The physical idea was to represent the large thermal cross section ( $> 10$  b) of some reactions by one strong resonance superimposed on a  $1/v$  background. The advantage of this method is the possibility it gives to reproduce the resonance integral in a better way than the  $1/v$  component alone. A full description of the method is given in Appendix 5 of the SAFEPAQ-II user manual [2]. The usefulness of the method is demonstrated in Figure 2, where C/E values for the  $(n,\gamma)$  resonance integral are plotted for EAF-2001 (no SRA) and EAF-2007 (SRA used). The greatly reduced scatter of the points about the line  $C/E = 1$  is evident.

Figure 2. C/E for  $(n,\gamma)$  resonance integrals for targets without SRA (EAF-2001) and with SRA (EAF-2007).

## LEA

The Low Energy Approximation (LEA) is a method of adding resonance data to (n,p) and (n, $\alpha$ ) reactions based on the resonances in the (n, $\gamma$ ) file. A full description of this method is given in Appendix 6 of the SAFEPAQ-II user manual [2]; here some examples of its application are given.

Figure 3 shows a reaction which has experimental data at thermal, in EAF-2003 the 1/v region was joined to the rising part of the curve at 0.1 MeV, in the current library (n, $\gamma$ ) data from the JEF-2.2 data source renormalized to the thermal (n, $\alpha$ ) cross section are added from 1 keV to 1 MeV. Figure 4 shows another example, here the resonances are at lower energy and the resulting cross section is much more physical than in the previous library. Figure 5 shows a case where there is no experimental thermal value for the (n,p) reaction. To overcome this lack the constancy of the ratio of the (n,p) to the (n, $\gamma$ ) cross section below 100 keV is used and the value calculated by TALYS at 10 keV is used for fitting. In EAF-2003 a default value at  $10^{-5}$  eV was assumed, while in EAF-2007 a much more physical cross section is available. Figure 6 shows a similar case with no thermal data for a (n, $\alpha$ ) reaction.

Figure 3. Data from EAF-2007 (Final) and EAF-2003 for  $^{32}\text{S}(n,\alpha)^{29}\text{Si}$ .

Figure 4. Data from EAF-2007 (Final) and EAF-2003 for  $^{97}\text{Mo}(n,\alpha)^{94}\text{Zr}$ .

Figure 5. Data from EAF-2007 (Final) and EAF-2003 for  $^{45}\text{Sc}(n,p)^{45}\text{Ca}$ .

Figure 6. Data from EAF-2007 (Final) and EAF-2003 for  $^{170}\text{Er}(n,\alpha)^{167}\text{Dy}$ .

## TALYS

TALYS [81] is a computer code system for the prediction and analysis of nuclear reactions. TALYS simulates reactions that involve neutrons, gamma-rays, protons, deuterons, tritons, helions, alpha-particles and fission, in the 1 keV - 200 MeV energy range and for target nuclides of mass 12 and heavier. This is achieved by implementing a suite of nuclear reaction models into a single code system. It enables the evaluation of nuclear reactions from the unresolved resonance region up to intermediate energies. Generally TALYS can be used in two distinct ways:

- Carry out a very detailed calculation with various adjusted parameters and choices for nuclear models, so that specific experimental data for one target nucleus are reproduced.
- For the large scale, default calculations for many nuclides, in which case adjustment to experimental data is impossible or, for the moment, not practical.

While the first method is generally used for detailed isotopic evaluations, it is clear that for activation libraries with many thousands of reactions the second method must be used.

All results are created using a script which runs TALYS with default input parameters. This means that the data from such a calculation have not been tested against individual experimental data for each isotope, therefore they are only as good as the global parameters available as input to the TALYS code.

The main nuclear models and methods used in TALYS are:

**Optical model** calculations are performed with the optical model potentials (OMP) of Koning and Delaroche [107]. For **compound nucleus** reactions the model of Moldauer, i.e. the Hauser-Feshbach model corrected for width fluctuations, is used.

**Coupled-channels** calculations are automatically invoked when a coupling scheme is available. For the **level density**, the composite formula proposed by Gilbert and Cameron, consisting of a constant temperature law at low energies and a Fermi gas expression at high energies is applied.

Energy-dependent **shell effects** are included. Gamma-ray **transmission coefficients** are generated with the Kopecky-Uhl generalized Lorentzian for strength functions. For **pre-equilibrium** reactions, which become important for incident energies above about 10 MeV, the two-component exciton model is used. Multiple pre-equilibrium emission up to any order of particle emission is included.

Further details on TALYS and how to obtain it can be found at the website [www.talys.eu](http://www.talys.eu).

## The Master database

The library development tool SAFEPQAQ-II contains several relational databases that contain data required in the construction of the EAF libraries. The Master database contains data for each required reaction taken from the original data sources, in cases where the reaction is split but the original data are for the total, the total is used for each split reaction. The data thus require many modifications to be carried out systematically before they can be used in EAF. Each original data source was converted into a source database and it is the entries in the source databases that are selected and used in Master.

The sequence of modifications that is applied to Master in the process of producing the Final database is fully described in the SAFEPQAQ-II User manual [2]. These include the checking of  $Q$ -values and thresholds, identification of reactions with suspect interpolation laws and removal of data points above 60 MeV. The branching and renormalisation are largely automatic, using data in the tables of the Parameter database. This contains all the relevant decay data extracted from the EAF decay data library such as isomeric spins. Spins are required during the branching process and SAFEPQAQ-II automatically

ensures that these are consistent in the decay and cross section libraries.

The original data in Master are not changed in any way; all modifications are applied to a copy held in Final. This means that the Master data are available at any time to be visualised; they can be compared with EXFOR data, other data sources and with Final data as the various modifications are progressively applied. If a new data source is required for a particular reaction there are tools available in SAFEPAQ-II to change the source in Master, create the modifications and apply these to generate the Final data.

## The Parameter database

The Parameter database contains all the information that describes a particular version of an EAF library. The list of reactions and their sources that is included in the library, the list of nuclides, their sources and properties and the set of experimental information that can be used to renormalize or split a particular cross section. These values are stored in a series of tables that are described fully in reference 2, but the most important are listed below to show the range of data.

- Energy boundaries of the group schemes.
- Systematic branching ratios as a function of spin.
- Decay data for all nuclides.
- Systematic error factors for reaction types.
- Experimental data at 25.3 meV, 30 keV and 14.5 MeV.
- Integral data in various neutron spectra.
- Log of all data changes.
- Pre-modifications and modifications.
- List of nuclides contained in libraries.
- List of reactions contained in libraries.
- Literature references.
- Resonance integral data.
- Neutron spectra data.
- Cross section systematics.
- Summaries of data in Final.
- Uncertainty data.
- Nuclide masses from Wapstra.
- Known biological hazard,  $A_2$  and clearance values.
- Details of the progress of library processing.

## Cross section systematics

Cross section systematics at various energies are algebraic formulae derived from the analysis of experiments that provide a type of ‘semi-experimental’ information. They can be used to judge the quality of

calculated or evaluated excitation curves and where experimental data are absent can also be used for renormalization. Work on testing of EAF-2007 using the new SACS methodology has led to new insights on the validity of the systematics. Some of the basic observations and recommendations are listed below:

**14.5 MeV systematics** - If the 14.5 MeV energy range is close to or at the maximum of the excitation curve,  $\sigma_{\text{sys}}$  can be safely used for validation as well for the SAFEPAQ-II renormalization modifications (RN-SYS). However, for many reaction channels for heavier mass targets or for targets with large asymmetries, the 14.5 MeV energy range is in the beginning of the steeply raising part of the excitation curve and in such cases  $\sigma_{\text{sys}}$  should be used only for comparison with the library data but never for renormalization. Based on this argument, the following recommendations are made concerning restrictions for renormalization of the major reactions channels:

- (n,2n), (n,n'p) and (n, $\gamma$ ) for all masses,
- (n,p) and (n, $\alpha$ ) reactions for targets with  $A > 130$  should always be checked against the  $\sigma_{\text{max}}(s)$  SACS analysis,
- (n,d) reaction only for targets with  $s \leq 0.1$
- (n,n' $\alpha$ ), (n,t), (n,h) and (n,2p) not at all.

**30 keV (n, $\gamma$ ), 3 MeV (n,n') and 20 MeV systematics** can be used only as indicative information for eventual modifications. The uncertainty factors of these systematics are large ( $\geq 100\%$ ).

**Use of RN-SYS in EAF-2007** – The usage of this modification for EAF-2007 was less than in previous libraries. It was applied for a limited number of (n,2n) reactions, for targets:  $^{86}\text{Zr}$ ,  $^{103}\text{Ru}$ ,  $^{168}\text{Er}$ ,  $^{178}\text{Hf}$ ,  $^{179}\text{Hf}$ ,  $^{192}\text{Ir}$ ,  $^{192}\text{Ir}$ ,  $^{193\text{m}}\text{Ir}$  and  $^{198\text{m}}\text{Au}$  and for one (n,d) reaction on  $^{15}\text{N}$ . It was also used selectively for a large number of (n,p) and (n, $\alpha$ ) reaction data in order to decrease the slight systematic overestimation noted in the TALYS calculations. Again, this was always done in combination with the  $\sigma_{\text{max}}(s)$  SACS analysis.

## 14.5 MeV systematics

The SAFEPAQ-II code contains information on the systematic formulae at 14.5 MeV; these are listed below for reference.

In the formulae below,  $s$  is the asymmetry parameter of the target nuclide =  $(N-Z)/A$  and all the cross sections are in mb. Note that the (n,2p) formula was new for EAF-2001 and the (n,n' $\alpha$ ) formula was new for EAF-2003. Starting with EAF-2005, SAFEPAQ-II contains the option to use either the standard or an alternate set of systematics for the (n,n'p+d) and (n,t) reactions. This is noted below where the

alternate formula is given. The standard formula can be found in the EAF-2003 report [69].

**(n,p)**

The systematics of Forrest [23] and Doczi *et al.* [108] are used:

$$\begin{aligned}\sigma_{np} &= 7.657(A^{1/3} + 1)^2 \exp(-28.80s - 59.24s^2 + 0.2365A^{1/2}) \quad Z \geq 40 \\ \sigma_{np} &= 23.659(A^{1/3} + 1)^2 \exp(-23.041(s + s^2)) \quad Z < 40\end{aligned}$$

**(n, $\alpha$ )**

The systematic of Majdeddin *et al.* [109] is used:

$$\sigma_{n\alpha} = 15.0678(A^{1/3} + 1)^2 \exp(-27.55(s + s^2))$$

**(n,d+n'p), (n,d) and (n,n'p)**

The systematics of Forrest [23], Kopecky [110] and Konobeyev [111] are used:

For light nuclei: ( $s \leq 0.125$ )

$$\begin{aligned}\sigma_{nd} &= 9.94 \exp(-0.11s) \\ \sigma_{nnp+d} &= 900.9(A^{1/3} + 1)^2 \{1 - 0.4828 \tanh(\xi + 1)\} \exp(-52.3s - 135.7/A)\end{aligned}$$

For heavy nuclei: ( $s > 0.125$ ). Note that for  $\sigma_{nd}$  the alternate form is shown.

$$\begin{aligned}\sigma_{nd} &= 53.066(A^{1/3} + 1)^2 A^{-1/3} (-1.912s + 0.011134Z / A^{1/3} + 0.30797)^3 \\ \sigma_{nnp+d} &= 900.9(A^{1/3} + 1)^2 \{1 - 0.4828 \tanh(\xi + 1)\} \exp(-52.3s - 135.7/A)\end{aligned}$$

$\xi$  is the difference between the proton and neutron separation energies.

Finally  $\sigma_{nnp}$  is for both cases calculated as  $\sigma_{nnp} = \sigma_{nnp+d} - \sigma_{nd}$

If this formula has a value less than or equal to zero then the following alternative is used:

$$\sigma_{nnp} = 0.1\sigma_{nd}$$

**(n,t)**

The systematic of Konobeyev [111] is used; note the units are  $\mu\text{b}$  and that the alternate form is shown:

$$\sigma_{nt} = 53066(A^{1/3} + 1)^2 A^{-1/3} (-0.35627s + 0.0045118ZA^{-1/3} + 0.047995 + \Delta)^3$$

with  $\Delta = 0$  for even-even target nuclei,  
 $\Delta = 4.7774A^{-3/4} - 1.0881A^{-1/2}$  for odd  $A$  target nuclei and  
 $\Delta = 9.5548A^{-3/4} - 2.1762A^{-1/2}$  for odd-odd target nuclei.

**(n,n'd)**

An approximate value is used; note that the standard form for (n,t) is used:

$$\sigma_{nd} = 0.1\sigma_{nt}$$

Thus using the formula given in reference 69:

$$\sigma_{nd} = \begin{cases} 0.1516(A^{1/3} + 1)^2 \exp(-24.35s + 0.2670A^{1/2}), & A \text{ even} \\ 440.21 \exp(-20.509s), & A \text{ odd} \end{cases}$$

**(n,h)**

The systematic of Lishan *et al.* [112] is used, note the units are  $\mu\text{b}$ :

$$\sigma_{nh} = 0.75(A^{1/3} + 1)^2 \exp(-11.338s)$$

**(n,n')**

The systematic of Vonach [25] is used. This is held as a table of values for various isomeric spins, and no analytic formula is presented.

**(n, $\gamma$ )**

The systematic of Kopecky *et al.* [30] is used:

$$\sigma_{n\gamma} = 1.18 - 1.13 \exp(-0.01338A)$$

**(n,2n)**

The systematic of Badikov *et al.* [115] is used, note that this is only valid if  $A \leq 210$ :

$$\sigma_{n2n} = 47.015(A^{1/3} + 1)^2 (1 - 3.9777 \exp(-24.116s))$$

**(n,2p)**

The systematic of Kopecky [62] is used, note the units are  $\mu\text{b}$ :

$$\sigma_{n2p} = 48.49 \exp(-2.99s)$$

Note that recent experimental data suggests that most previously available data were upper estimates and thus the systematic is

overestimated. Consequently it was not used for renormalisation in EAF-2007, but was still used for validation.

### $(n, n'\alpha)$

The systematic of Kopecky [69] is used:

$$\sigma_{nn\alpha} = 17.48 \exp(-24.2s)$$

## 3.0 MeV systematics

### $(n, n)$

The systematic of Shimizu *et al.* [113] is used:

$$\sigma_{nn'} = (A^{1/3} + 1)^2 \exp(-0.110\Delta^2 + 0.0.686\Delta + 4.21)$$

where  $\Delta$  is the difference between the isomer and ground state spins ( $J_m - J_g$ ). Note that this systematic is new in EASY-2007.

## 20.0 MeV systematics

The systematics of Konobeyev [111] are used and can be applied for  $A > 40$  target nuclei. They have been obtained on the basis of calculated cross sections for 245 stable nuclei with  $40 < A < 209$ .

### $(n, n'p)$

$$\sigma_{nnp} = 53.066(A^{1/3} + 1)^2 \{A^{-1/3}(-2.7098(s + 1.5/A) + 0.67115)^2 + \exp[-496.74(s + 1.5/A)^2 + 48.162(s + 1.5/A) - 1.6714]\}$$

### $(n, p)$

$$\sigma_{np} = 53.066(A^{1/3} + 1)^2 \exp[-47.384(s + 1/A)^2 - 2.3294(s + 0.5/A) - 0.10405Z/A^{1/3} - 2.3483] \text{ if } Z < 50$$

$$\sigma_{np} = 53.066(A^{1/3} + 1)^2 (-1.2477(s + 1/A) + 0.4087)^3 \text{ if } Z \geq 50$$

### $(n, d)$

$$\sigma_{nd} = 53.066(A^{1/3} + 1)^2 A^{-1/3} (-1.3107s + 0.0019167Z/A^{1/3} + 0.48491)^3$$

### $(n, t)$

Note the units are  $\mu\text{b}$ ,

$$\sigma_{nt} = 53066(A^{1/3} + 1)^2 A^{-1/3} (-0.1506s + 0.000306ZA^{-1/3} + 0.19566 + \Delta)^3$$

with  $\Delta = 0$  for even-even target nuclei,

$$\Delta = 0.89317A^{-3/4} - 0.10839A^{-1/2} \text{ for odd } A \text{ target nuclei and}$$

$$\Delta = 1.78634A^{-3/4} - 0.21678A^{-1/2} \text{ for odd-odd target nuclei.}$$

**(n,  $\alpha$ )**

$$\sigma_{n\alpha} = 53.066(A^{1/3} + 1)^2 \exp[-37.317(s + 1/A)^2 - 7.2027(s + 0.5/A) - 0.22669Z/A^{1/3} - 2.027] \text{ if } Z < 50$$

## 30.0 keV systematics

The SAFEPAQ-II code contains information on the systematic formula at 30 keV for the (n, $\gamma$ ) reaction, this was a new systematic for EAF-2001 derived by Kopecky. Details of its derivation are presented in reference 62.

**(n,  $\gamma$ )**

The systematic of Kopecky is used:

$$\sigma_{n\gamma} = C_1(aU)^{C_2}$$

Values of  $a$  are stored in a table in the Parameter database for various values of number of neutrons ( $N$ ).  $U$  is defined in terms of the  $Q$ -value and the pairing energies by  $U = Q(n, \gamma) - P(Z) - P(N)$ . The pairing energies are given in the same Parameter table. Values of the fitting parameters  $C_1$  and  $C_2$  depend on whether the number of protons ( $Z$ ) is odd or even.

$$C_1 = 8.236 \times 10^{-8}, C_2 = 4.827 \quad Z \text{ odd}$$

$$C_1 = 6.995 \times 10^{-7}, C_2 = 4.287 \quad Z \text{ even}$$

## Non-elastic systematic

The SAFEPAQ-II code contains information on the systematic formula for the non-elastic cross section for incident neutrons with energies between 1 and 50 MeV.

In the formula below,  $A$  is the target mass,  $E$  is the neutron energy in MeV and the cross section is in mb. Note that this formula was new for EAF-2005.

The systematic of Chatterjee *et al.* [114] for  $1 \leq E \leq 50$  MeV is used:

$$\sigma_{\text{nonel}} = (31.05A^{-1/3} - 25.91)E + 342A^{1/3} + 21.89A^{2/3} + (0.223A^{4/3} + 0.673A^{2/3} + 617.4) / E$$

## Error factors

Related to the systematic formulae are values of the error factor ( $f$ ) which quantify how well the systematic fits the experimental data. The error factor derived from the systematics is used in the generation of the uncertainty file if no experimental data are available. Table 1 lists the error factors used in SAFEPAQ-II.

Table 1. Error factors derived from systematics.

Reaction	Systematic	Error factor ( $f$ )
(n,n')	Vonach [25]	2.0
(n,2n)	Badikov [115]	1.4
(n,3n)	Estimate	3.0
(n,4n)	Estimate	3.0
(n,n' $\alpha$ )	Estimate	3.0
(n,d)	Forrest [23]	3.0
(n,n'p)		2.0
(n,t)+(n,n'd)	Forrest [23]	1.6
(n,n't)	Estimate	5.0
(n,n'h)	Estimate	5.0
(n,f)	Estimate	2.0
(n, $\gamma$ )	Kopecky [30]	2.0
(n,p)	Forrest [23]	1.5
(n,h)	Lishan [112]	1.9
(n, $\alpha$ )	Madjeddin [109]	1.6
(n,p $\alpha$ )	Estimate	3.0
(n,2p)	Estimate	3.0
(n,n'2p)	Estimate	3.0
(n,2 $\alpha$ )	Estimate	3.0
(n,3 $\alpha$ )	Estimate	3.0
(n,2np)	Estimate	3.0
(n,2nd)	Estimate	3.0
(n,pd)	Estimate	3.0
(n,pt)	Estimate	3.0
(n,d $\alpha$ )	Estimate	3.0

## Branching ratio

The splitting of a total cross section between isomeric daughters is a major data adjustment task carried out by SAFEPAQ-II. If at least two experimental values are available at 14.5 MeV (out of a total of three:  $\sigma_{tot}$ ,  $\sigma_g$  and  $\sigma_m$ ), then the branching ratio can be deduced and applied to the total cross section.

Table 2. Branching ratio ( $b = \sigma_m/(\sigma_g + \sigma_m)$ ) as a function of the isomeric state spin ( $J_m$ ).

$J_m$	Single-particle emission at 14.5 MeV	(n, $\gamma$ ) reaction at 0.0253 eV	Multi-particle emission at 14.5 MeV
0	1.90E-01	4.20E-01	1.40E-01
0.5	2.40E-01	5.00E-01	2.00E-01
1	3.10E-01	6.00E-01	3.10E-01
1.5	3.90E-01	7.00E-01	4.40E-01
2	4.80E-01	8.00E-01	6.00E-01
2.5	7.50E-01	7.50E-01	7.70E-01
3	6.70E-01	6.90E-01	7.50E-01
3.5	6.70E-01	4.90E-01	7.50E-01
4	6.40E-01	3.50E-01	7.20E-01
4.5	6.00E-01	2.50E-01	6.70E-01
5	5.20E-01	1.80E-01	6.20E-01
5.5	4.40E-01	1.30E-01	5.60E-01
6	3.80E-01	9.60E-02	5.00E-01
6.5	3.00E-01	6.20E-02	4.40E-01
7	2.20E-01	4.00E-02	3.90E-01
7.5	1.60E-01	2.50E-02	3.30E-01
8	1.10E-01	1.60E-02	2.80E-01
8.5	7.50E-02	1.00E-02	2.30E-01
9	5.00E-02	6.20E-03	1.90E-01
9.5	3.40E-02	3.80E-03	1.55E-01
10	2.20E-02	2.30E-03	1.15E-01
10.5	1.40E-02	1.50E-03	9.00E-02
11	9.00E-03	9.50E-04	6.70E-02

19.5	5.42E-06	5.81E-07	5.12E-05
20	3.52E-06	3.83E-07	3.35E-05

In cases where no experimental information on cross sections to ground or isomeric state is available, branching ratio systematics are used. The original systematics of neutron-induced isomer cross section ratios at 14.5 MeV [24], based on simplified GNASH calculations have been revised. This revision was based on recent experimental data and results of model calculations [116,117,118]. It is applied to all threshold reactions at 14.5 MeV. The new recommended values are listed in columns 2 and 4 of Table 2.

In order to account more accurately for the specificity of the branching ratio for radiative capture (thermal and resonance regions) and its strong energy dependence, the following approach has been adopted. Two branching ratios, one for the thermal and resonance range ( $b_L$ ) up to energy  $E_H$  (end of resolved resonance range) and one for the high-energy range ( $b_H$ ), have been adopted.

For the low-energy range all available experimental data at thermal energies were used and the derived branching ratio was assumed representative for this energy range. Further systematics have been derived from these data by a simple eye-guide procedure [119] and the recommended values are given in column 3 of Table 2.

For the smooth high-energy part, starting from the energy  $E_H$ , the systematics for one-particle emission in Table 2 have been used. The energy dependence of the branching ratio for (n, $\gamma$ ) systematics has been introduced in the following way. The value of  $b_L$  is kept constant up to  $E_H$  and then linear interpolation is used to connect with the  $b_H$  value at 14.5 MeV. This approach has been tested against a few rigorously evaluated branching ratios [116,117,118] produced with the code GNASH and there is reasonable agreement.

## Q-values

The procedure which calculates the reaction  $Q$ -values and energy threshold uses data from the Audi-Wapstra mass-excess table [120]. This table covers 2,655 nuclei and is supplemented with the Duflo-Zuker empirical mass formulae [121] when the nuclei do not exist in the table (for 64 nuclei). It should be noted that SAFEPAQ-II

generates  $Q$ -values and threshold energy modifications automatically. A total of 6,118 such modifications are carried out, this represent 9.3% of the source evaluations.

## High-energy data

### *Introduction*

Versions of EAF prior to EAF-2005 were developed primarily for use in calculations of fusion devices. For such applications the upper energy limit of 20 MeV is sufficient. However, it has been recognised that the materials testing that is foreseen as necessary in parallel with ITER, using proposed devices such as IFMIF [76], means that this energy limit needed to be raised – this was done for EAF-2005. The IFMIF facility will be a d-Li device with deuterons accelerated to 40 MeV impinging on a flowing Li target and generating an intense neutron field by a stripping reaction. It is expected that the neutron spectrum will contain a significant number of neutrons above 20 MeV, probably as high as 55 MeV. To enable activation calculations to be carried out for IFMIF, EAF needed to be extended to handle neutrons with energies  $> 20$  MeV.

The first decision to be made was the value of the new upper energy. By limiting this to 60 MeV it was judged possible to retain the same methodology as previously used. Such an energy is adequate for IFMIF but would not be large enough for applications such as incineration of nuclear waste using accelerators. Since IFMIF was the primary application this limit was judged suitable and this value is also used within the EFDA specification of the work. At energies above 20 MeV many new reaction types involving the emission of multiple particles are possible. Enumerating all these explicitly becomes impractical as the energy becomes too large. It was demonstrated with EAF-2005 that the use of a limited number of new reaction classes for EASY was feasible, and the same format is used for EAF-2007.

### *Extending the data library*

Although there are some measurements and evaluated libraries with data  $> 20$  MeV, these are rather sparse and for a source of cross section data at high energies it is necessary to rely on calculation. There is a major code development project underway led by A. J. Koning (NRG Petten) involving the TALYS code system [81]. This is a very versatile system enabling the production of a wide range of data using a unified set of models. As part of this development a series of libraries was produced containing activation cross sections for energies up to 60 MeV. Feedback on early libraries enabled many bugs and problems with the code to be removed. The data libraries

labelled TALYS-6 and TALYS-6a were read into SAFEP AQ-II and were used as the basis for the production of EAF-2007.

Table 3. New reaction types in EAF-2005 and EAF-2007.

Reaction type	MT number	Reaction type	MT number

(n,t $\alpha$ )	155	(n,n'dh)	187
(n,4np)	156	(n,n'th)	188
(n,3nd)	157	(n,n't $\alpha$ )	189
(n,n'd $\alpha$ )	158	(n,2n2p)	190
(n,2np $\alpha$ )	159	(n,ph)	191
(n,7n)	160	(n,dh)	192
(n,8n)	161	(n,h $\alpha$ )	193
(n,5np)	162	(n,4n2p)	194
(n,6np)	163	(n,4n2 $\alpha$ )	195
(n,7np)	164	(n,4np $\alpha$ )	196
(n,4n $\alpha$ )	165	(n,3p)	197
(n,5n $\alpha$ )	166	(n,n'3p)	198
(n,6n $\alpha$ )	167	(n,3n2p $\alpha$ )	199
(n,7n $\alpha$ )	168	(n,5n2p)	200
(n,4nd)	169		

There were two main tasks that had to be carried out with the TALYS data. Firstly all reactions with data only up to 20 MeV required extending using TALYS data (note that for some reactions data were missing from TALYS-6a and another data source such as IEAF-2001 [85] was used). It was decided that the TALYS-6a data above 20 MeV should be renormalized so as to fit smoothly onto the existing data at 20 MeV. The scaling factor for each reaction ( $f$ ) was stored in SAFEP AQ-II. Secondly, the new reactions introduced in EAF-2005 and which typically used data from TALYS-5 were updated so that by default the source was TALYS-6a. In addition the data for reactions

on the new targets in EAF-2007 were also taken from TALYS-6a. In collaboration with Koning new reaction classes and non-ENDF MT numbers ( $151 < MT < 201$ ) were defined for EAF-2005. The reaction MT number is the method used in ENDF formatted nuclear data files to refer to a type of reaction. These and reactions with existing MT numbers but no examples in EAF-2003 are shown in Table 3. Note that reactions with up to 8 emitted particles are defined.

Examples of a reaction where the data are smoothly extended above 20 MeV and a reaction new to EAF-2007 (a short-lived target not in EAF-2005) are shown in Figure 7 and Figure 8 respectively.

Figure 7. Data from EAF-2007 (Final) for  $^{27}\text{Al}(n,p)^{27}\text{Mg}$ , above 20 MeV these are taken from TALYS-6a. The symbols are experimental data points taken from EXFOR.

Figure 8. Data for  $^{62}\text{Zn}(n,3n)^{60}\text{Zn}$  taken from TALYS-6a.

## EAF-2007 production

### Data origin

EAF-2007 was generated starting with the information present in EAF-2005.1. Data were then changed based on new sources and experimental data. The new data sources available are:

- The latest beta release of the US library, ENDF-B/VII $\beta$ 2.
- The European JEFF-3.1 library [122].
- Calculations by V. Avrigeanu *et al.* for  $^{181}\text{Ta}$  and Hf isotopes [123].
- The calculated libraries TALYS-6 and TALYS-6a prepared by A.J. Koning covering an even wider range of targets than EAF.
- Evaluation by P. Pererslatsev *et al.* for W isotopes [124].
- The dosimetry library IRDF-2002 released by the IAEA [125].
- The JENDL high energy file [126].
- Files produced by the WPEC subgroup 23 for fission products [127].

### Summary of reaction types

It is useful to show how the reactions in the library can be divided into different categories; a number of relevant statistics are given in

this section. Firstly, the data origin - the neutron cross sections included in EAF come from numerous sources having varying levels of quality and formats.

It will be noted that in Table 4 some sources contain (MDF) in the label, e.g. JEF-2.2(MDF). Usually it is possible to reproduce data in EAF-99 by using the original data source and then applying the standard modifications. However, in a few cases changes have been made in previous EAF versions that are not fully documented. In these cases data have been extracted from the EAF-99 MDF (Master Data File).

<b>Total</b>	<b>65565</b>

The entire EAF-2007 reaction list is given in Appendix 4. It contains target and daughter state, data origin information, Quality scores, types of modifications and the number of data points for each reaction stored in the EAF-2007 point-wise file.

Secondly, the reaction types - 86 different reaction types can be found in EAF-2007 and these are listed in Table 5. There is a very large increase over the 23 types in EAF-2003. All kinematically allowed reactions below 60 MeV are specified for each target isotope. These include threshold reactions as well as certain break-up channels on light nuclei. 816 target isotopes, for which all the major reaction types exist, are present in the file.

If new, *i.e.* short-lived or exotic, isotopes are to be included as targets, it is important to ensure that data are included for all the major channels. As a general rule including data for only a subset of the reaction channels is of limited use, and can lead to incorrect conclusions when used for inventory calculations.

### **EAF-2007 (n, $\gamma$ ) reaction**

Improvements to the neutron capture data have been concentrated in the following areas:

- Changing the data source and improving  $E_V$  and  $E_H$  values
- Improved  $1/\nu$  region renormalisation based on C/E data.

It is useful to show how the (n, $\gamma$ ) reactions can be divided into different categories, and a number of statistics are given in this section. Firstly, the final states of the EAF-2007 (n, $\gamma$ ) reactions are split as shown in Table 6.

Table 6. Numbers of different final states in EAF-2007.

Reaction	FS = 0	FS = 1	FS = 2	Total
(n, $\gamma$ )	812	224	18	<b>1054</b>

Every target leads to an FS = 0 state. Note that there are 816 targets in the EAF-2007 library, however there are no (n, $\gamma$ ) reactions for  $^3\text{H}$ ,  $^4\text{He}$ ,  $^{247}\text{Pu}$  and  $^{257}\text{Es}$ . Hence a total of 812 target isotopes in the library undergo a (n, $\gamma$ ) reaction. The (n, $\gamma$ ) cross section data are from a range of sources, and the number of reactions from each is shown in Table 7.

Table 7. The number of capture reactions from each data source in EAF-2007.

### **EAF-2007 $(n,\gamma)$ evaluation tools**

Different evaluation tools and model codes have been used to generate the data that are lacking from the available major evaluated data libraries. They are: TALYS, FISPRO, MASGAM and MASGAM + SIG-ECN which are described above and in more detail in reference 55.

Several new evaluations were performed using the code NGAMMA for EAF-2001; a few of these data are still used in EAF-2007. The code NGAMMA [93] was adopted for fast calculations of  $(n,\gamma)$  cross sections in a similar way to MASGAM. Many input parameters (optical model parameters, level densities, gamma-ray strength functions) can be prepared from available global systematics or can be inputted manually using local parameters.

The non-threshold reactions  $(n,\gamma)$  and  $(n,f)$  should contain resonance data. While this is the case for important targets, many targets do not have this information. In cases where experimental resonance data exists it has been possible to add a single s-wave resonance at a suitable energy so that the correct resonance integral can be obtained. This Single Resonance Approximation (SRA) is described above; it has been applied to about 90 reactions in EAF-2007.

**EAF-2007 actinide targets**

The content of the EAF-2007 actinide sub-file includes 102 targets, ranging from  $^{211}\text{Rn}$  up to  $^{257}\text{Fm}$ . Only minor improvements apart from new targets have been made in this sub-file in the production of EAF-2007. There are 5,865 reactions in EAF-2007 on actinide targets compared to 5,468 in EAF-2005.

Data sources have been changed for most targets, generally to TALYS-6a. The data sources and reaction types for the actinide targets are listed in Tables 9 and 10. The resulting sub-file can be claimed to be the most complete evaluated actinide data file available.

cross section at high energies (usually important when  $E > 1$  MeV). INT indicates that the interpolation law has been changed in an energy range. MERGE indicates that a second data source has been used at high (Mod Type = 13) or low (Mod Type = 18) energies and ADJUST means that the energy or cross section value of a data point have been adjusted.

The Quality score is a value introduced in EAF-2003 that indicates the agreement of the library data with available experimental data. Both differential and integral data are considered. The meaning of the scores is shown in Table 12.

Table 12. EAF-2007 Quality scores.

Score	Description
0	No experimental data exists
1	Limited differential data which disagrees with the library (weak disagreement)
2	Limited differential data which agrees with the library (weak agreement)
3	Differential data which disagrees with the library (strong disagreement)
4	Differential data which agrees with the library (strong agreement)
5	Both differential and integral data exist or only integral data exist and these are not in agreement with the library
6	Both differential and integral data exist and they are in agreement with the library (validation)

### **EAF-2007 modifications**

SAFEPQA-II carries out a large number of modifications (and pre-modifications), most automatically (dependent on the various flags set up in the Parameter database) but some through single reaction processing. The procedures carried out for branching are complex and are described in detail in the SAFEPQA-II User manual [2]. Table 13 shows some statistics on the various modifications that are carried out; a brief description of the Mod type is also given. Note that reactions may have more than one modification.

Table 13. EAF-2007 modification numbers.

Mod Type	Description	Number of Pre-mods	Number of Mods
1	Add extrapolated points	0	0
2	Renormalize to systematics	91	1576
3	Renormalize to experiment	0	836
4	Renormalize by factor	0	7439
5	Remove data points	13	81
6	Renormalize by linear energy dependent branching ratio	0	445
7	Change $Q$ -value	314	5804
8	Change number of points	0	34639

Table 14 shows that 29,751 reactions (45.4%) are completely untouched. These represent mostly high threshold reactions for which there are no experimental data or systematics and where the data are taken from TALYS. For the majority of reactions (54.6%), some modification has been made by SAFEP AQ-II to improve the data that exist in the various source libraries, making it more suitable for activation and transmutation related applications.

## EAF-2007 validation

EAF-2007 can be tested by the validation options in SAFEP AQ-II for consistency with the available experimental database or with predictions from systematics. Two main validation processes can be performed; one internal where comparison is performed against the database stored in the Parameter database and the other external where EAF-2007 excitation functions are compared either with EXFOR or other evaluated data files.

The EXFOR CD-ROMs are used by SAFEP AQ-II; data are selected from these and placed in the SAFEP AQ-II database EXFOR. It is from the latter that datasets can be displayed during visualisation. Considerable efforts have been to ensure that the EXFOR data selected are both correct (daughter isomeric state and cross section units are two examples of checks) and complete. Checks have been made to ensure that all the available experimental data above 20 MeV have been selected to improve the high-energy region of the library.

Some recent experimental data sets are not yet present in EXFOR. To allow these data to be used for the graphical comparisons a recently introduced feature of SAFEPQAQ-II was used. This allows experimental data to be entered into the Private EXFOR database, once entered these data are automatically included in the graphs along with the existing EXFOR data.

The very significant increase in the number of reactions compared to EAF-2003 (factor 5) has not been matched by the increase in EXFOR data (factor 1.04 increase in data sets, but only 1.01 increase in number of reactions). Consequently only about 2.5% of the EAF-2007 library has been visually validated by comparing the excitation function with the experimental EXFOR database over the entire energy range. The EXFOR validation indicated reactions which required revisions. Two different ways of correcting the data have been applied:

- Replacement by a new evaluation (either from another source or a new calculation), in particular for cases with shape problems in the excitation function.
- Renormalisation of the whole or part of the excitation function through the interactive options available in SAFEPQAQ-II.

The results of integral experiments have also been used to adjust data. Validation of activation code predictions, and thereby of the cross section and decay data, has been carried out by means of direct comparison with measurements of various materials under fusion-relevant neutron spectra. Having access to a variety of sources has allowed the energy dependence of the analysis to be very complete. For the EASY-2005 validation [128] integral data became available at energies above 20 MeV. The feedback from this validation exercise have been used in the generation of EAF-2007. Materials samples were irradiated in a wide range of simulated D-T neutron fields at JAERI FNS, Serгиеv Posad SNEG-13, FZK Isochron-cyclotron, ENEA FNG and the Řež cyclotron, and different responses such as neutron spectra, emission spectra, kerma, activity and decay heat have been measured, allowing direct comparison with the code predictions [129,130,131,132,133,134,135,136,137,138,139,140,141,142,143,144,145,146,147,148,149,150,151,152,153,154,155,156,157,158,159,160,161,162,163,164,165,166,167,168]. A summary of the integral data and details of the validation of EASY-2001 [67] and EASY-2003 [169] are given in a recent paper [170].

The results of the different validation exercises, combined with other sources of information, led to a set of corrective actions to be carried out on some important reactions. These have been implemented in EAF-2007, and include cross section renormalisation, shape correction in a given energy range, threshold and  $Q$ -value correction,

partial cross section adjustment and some new energy-dependent isomeric branching ratios. The fact that these benchmarks were performed by several research institutions using different activation codes and decay data has allowed clarification of the reasons for many discrepancies. These have been found to be partly due to inaccurate decay data, partly to inaccurate cross section data, and partly to a variety of inadequate calculational processes. A list of reactions that have been changed in response to the validation process in EAF-2007 is shown in Table 15.

Table 15. Details of changes in EAF-2007 following validation.

Reaction	Comment
$^{23}\text{Na}(n,2n)^{22}\text{Na}$	Renormalize to experimental data at 14 MeV.
$^{37}\text{Cl}(n,p)^{37}\text{S}$	New data source ENDF/B-VII.2, renormalize to experimental data at 14 MeV.
$^{32}\text{S}(n,p)^{32}\text{P}$	New data source JENDL-3.3, renormalize to experimental data at 19.5 MeV.
$^{44}\text{Ca}(n,p)^{44}\text{K}$	New data source TALYS-6.
$^{50}\text{Cr}(n,2n)^{49}\text{Cr}$	New data source IEAF-2001.
$^{53}\text{Cr}(n,p)^{53}\text{V}$	New data source JENDL-3.3, renormalize to experimental data at 20 MeV.
$^{54}\text{Fe}(n,t)^{52\text{g.m}}\text{Mn}$	New data source TALYS-6, remove energy shift.
$^{57}\text{Fe}(n,p)^{57}\text{Mn}$	New data source ENDF/B-VI.8, renormalize to experimental data at 20 MeV.
$^{58}\text{Ni}(n,t)^{56}\text{Co}$	New data source TALYS-6a.
$^{90}\text{Zr}(n,p)^{90\text{m}}\text{Y}$	New data source ADL-3, renormalize to experimental data at 14 and 25 MeV.
$^{98}\text{Mo}(n,p)^{98\text{m}}\text{Nb}$	New data source TALYS-6a, renormalize to systematics.
$^{165}\text{Ho}(n,2n)^{164\text{g.m}}\text{Ho}$	New data source TALYS-6.
$^{181}\text{Ta}(n,n'\alpha)^{177\text{m}}\text{Lu}$	New data source TALYS-6, renormalize by factor.
$^{181}\text{Ta}(n,\alpha)^{178\text{g.m}}\text{Lu}$	New data source TALYS-6.
$^{186}\text{W}(n,n'\alpha)^{182\text{m}}\text{Hf}$	New data source TALYS-6a.
$^{232}\text{Th}(n,f)$	New data source JENDL-3.3, renormalize to experimental data at 20 MeV.

Many modifications were also applied based on the experimental data above 20 MeV, identified in an extensive survey [171]. An example where the cross section has changed significantly is shown in Figure 9 where for EAF-2005 the experimental data were not used to adjust the library data which is consequently too large.

Figure 9. Data from EAF-2007 (Final) and EAF-2005 for  $^{64}\text{Zn}(n,3n)^{62}\text{Zn}$ .

### Experimental validation - cross section

The experimental data available for selected cross section channels at three energy ranges, 14.5 MeV, 30 keV (for (n, $\gamma$ ) reactions) and 0.0253 eV held in the Parameter tables can be compared with the values in Final leading to the corresponding C/E values (C refers to the library value and E to the experimental data). These are plotted for the various reaction channels. Figure 10 - Figure 15 present a selection of results from such a comparison. This process is an interactive one, thus the data in the file have been corrected using feedback from the early comparisons. This method presents clear advantages: criteria can be set to decide when to apply a renormalisation process and detailed inspection indicates deficiencies that can be traced to either the raw data or to their treatment in SAFEP AQ-II.

The (n, $\gamma$ ) experimental validation results are presented separately due to their importance and specificity. Such comparisons are made at thermal energy, 30 keV and at about 14.5 MeV and are based on a compilation of many references [11,37,48,50,60,172,173,174]. An ideal C/E ratio would clearly be 1, but in practice there is a distribution of C/E about this value. The number of C/E ratios available (the individual experimental results are flagged to show if they are to be used for validation) for testing EAF-2007 is shown in Table 16.

Table 16. Number of (n, $\gamma$ ) experimental values available for each final state. FS = 99 indicates a total cross section.

FS	Thermal	30keV	14.5Me	Total
99	591	342	67	<b>1000</b>
0	97	3	0	<b>100</b>
1	97	27	0	<b>125</b>
2	7	1	0	<b>8</b>
<b>Total</b>	<b>792</b>	<b>373</b>	<b>67</b>	<b>1233</b>

A histogram may be formed from the distribution of C/E values, and such plots at each energy for the (n, $\gamma$ ) reactions are shown in Figure 10 to Figure 12.

Figure 10. C/E distribution at 14.5 MeV for (n, $\gamma$ ) in EAF-2007.

Figure 11. C/E distribution at 30 keV for (n,γ) in EAF-2007.

Figure 12. C/E distribution at 0.0253 eV for (n,γ) in EAF-2007.

Figure 10 to Figure 12 show generally close agreement between the experimental values and the EAF-2007 data, with most C/E values close to a value of 1. This confirms the high quality of the (n,γ) cross

section data available in the EAF-2007 library. Some small C/E values may be noted in Figure 11, they tend to be for nuclides which have a resolved resonance region around 30 keV. From such figures one can also note that 75% of the data can be compared with existing experimental measurements at thermal energy, 35% can be compared at 30 keV and only 6% at the energy range particularly important for fusion applications: 14.5 MeV.

It is clear from Figure 13 that the amount of experimental data available at 14.5 MeV (for all reactions) is limited. Although EAF-2007 contains 65,565 reactions only 23,745 have data at 14.5 MeV, the rest only containing data at higher energies. The experimental data at this energy covers only 6.8% of the reactions. It is rather interesting to note from Figure 15 that some fission reaction are still not that well known, but it is fair to say that they belong to a set of rather unimportant fissionable nuclides.

These plots in conjunction with those presented earlier clearly demonstrate the state of the experimental data base today. However, since less than 3% of all EAF-2007 reactions can be compared with experimental information, this indicates both that more experimental efforts are required and that activation libraries also need to be compared to other quantities as described in the following sections.

Figure 13. C/E distribution at 14.5 MeV for all reactions in EAF-2007.

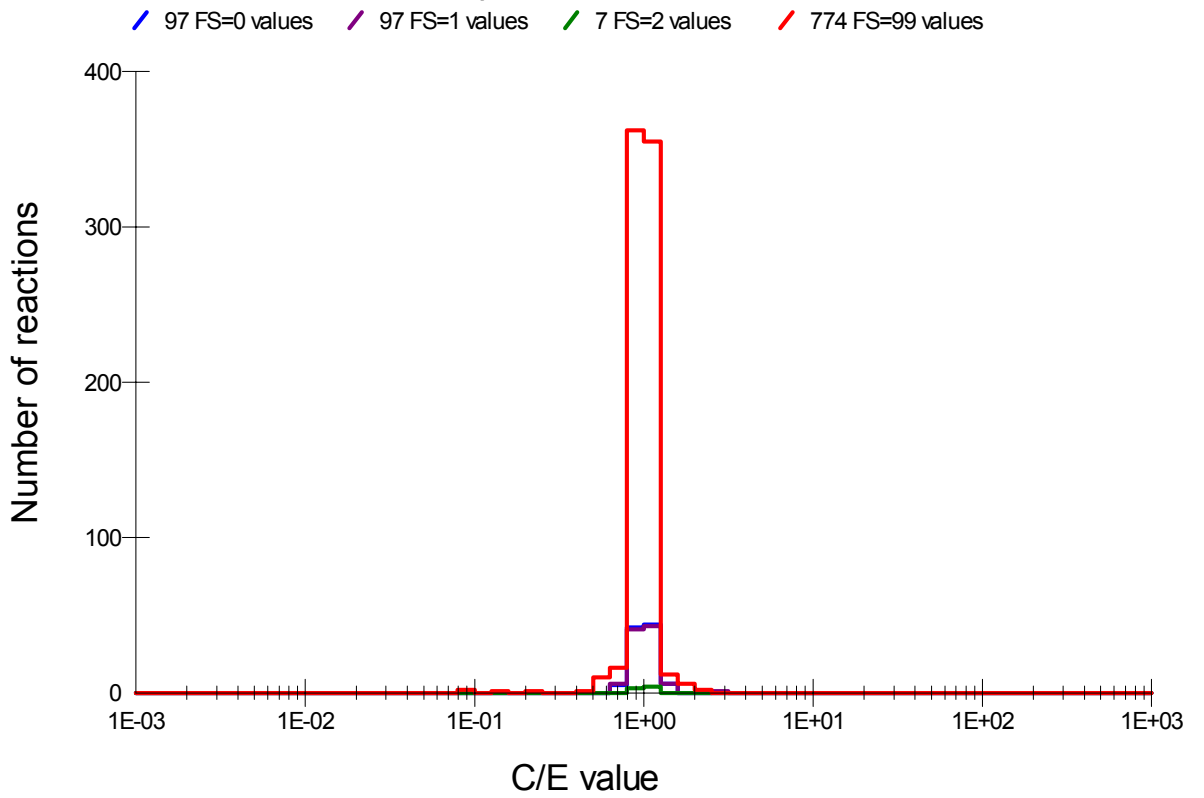

Figure 14. C/E distribution at 0.0253 eV for all reactions in EAF-2007.

Figure 15. C/E distribution at 0.0253 eV for (n,f) in EAF-2007.

### Experimental validation - resonance integral

Another very important experimental validation process can be carried out on the resonance integrals of certain reaction channels. To calculate the resonance integral the EAF-2007 data (which are Doppler broadened to 300 K) are integrated from 0.5 eV to 100 keV. Such a validation allows a clear assessment of the quality of the cross sections profile over a wide energy range. The experimental data base is, however rather sparse with many deficiencies. One example is when the (n,p) and (n, $\gamma$ ) channels, which both count as absorption, simultaneously exist over the entire energy range and so contribute to the depletion term often given in experimental compilations. Figure 16 shows the C/E distribution for resonance integrals.

There has been some change in the resonance data for all the reactions, and this reflects the slight improvement in the C/E plot in EAF-2007 compared to EAF-2005.

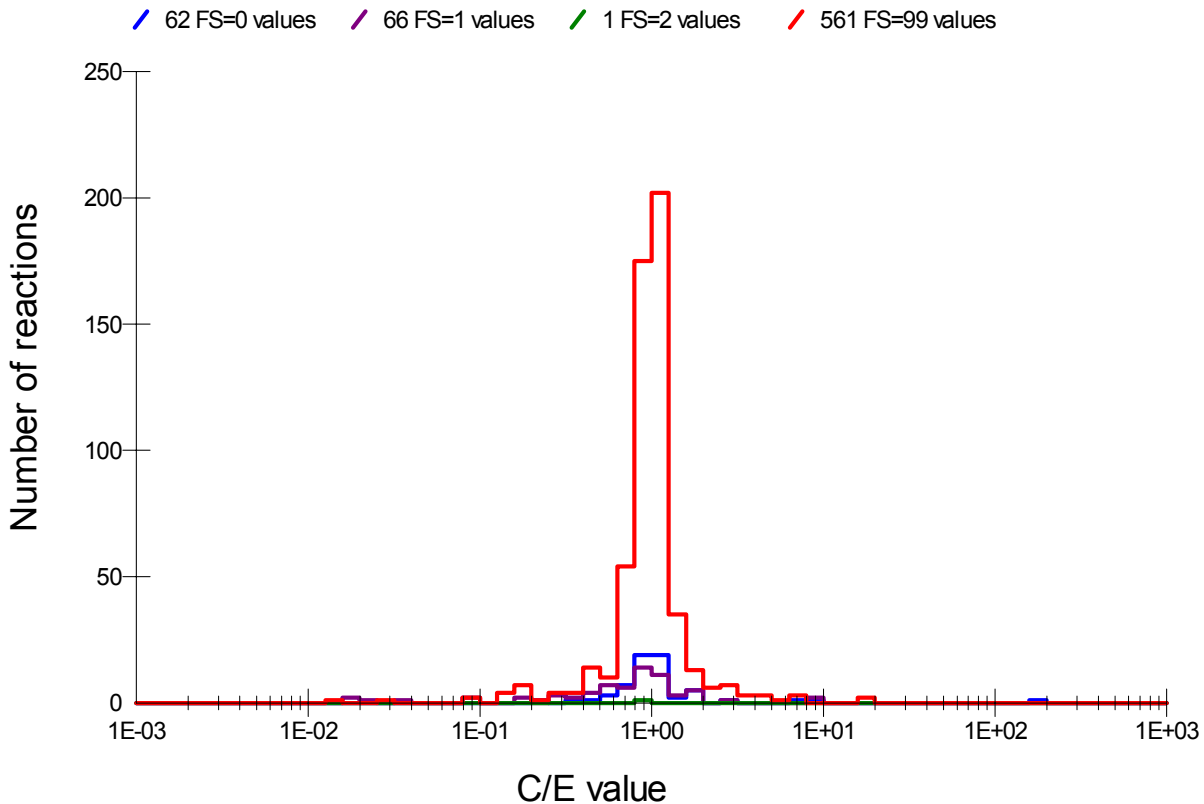

Figure 16. C/E distribution of resonance integrals in EAF-2007.

### Systematic validation

The predictions from systematics available for selected cross section channels at 14.5 and 20 MeV can be compared with the values contained in the library leading to corresponding C/S values (C refers to the library value and S to the systematics prediction). Figure 17 - Figure 31 present the results of the comparison for EAF-2007. The same analysis of the individual reaction channels, that was carried out

for the experimental validation can be applied here. Comparison with systematic predictions can be carried out for many channels; however, certain limitations do apply: the energy is limited to 14.5 and 20 MeV, only total cross section C/S value can be compared, the validity of the formulae used may not cover the complete mass range and systematic formulae do not always account for competing reactions.

This clearly indicates that if one want to use information derived from C/S validation procedures, say for renormalisation, then one has to proceed with caution. This information does evidently present some advantages but the limitations described earlier tend to make its general implementation difficult.

From Figure 17, where all the C/S values are presented, one can immediately deduce the broad coverage, with 35% of the reactions with data at 14.5 MeV compared. This in itself is quite an achievement and tends to demonstrate the rather satisfactory behaviour of the systematic formulae. It is important to keep in mind here that the same data, but in lesser number, have been previously compared with experimental information.

Figure 20 shows the C/S values for the (n,d) reaction at 14.5 MeV. It is important to note that the peak of the histogram is now centred at about 1 rather than the value of 10 found for EAF-2005. This improvement in the predictive power of TALYS is partly due to feedback of this problem to the code author.

A similar remark applies to the (n,t) histogram shown in Figure 23. However, for (n,2n), (n, $\alpha$ ) and (n,p) the histograms (Figure 18, Figure 19 and Figure 22) show no significant improvement over EAF-2005.

Figure 24 and Figure 25 representing the C/S values for the (n,n' $\alpha$ ), and (n,n'p) reactions, clearly demonstrate the difficulties encountered in applying systematic formulae for these reactions. One of the reasons for the broad C/S distribution is the even/odd effect which is not considered in the systematics. Differences of about an order of magnitude can commonly be spotted that highlight less than satisfactory library contents. However, those are not major reactions and it has been shown by inventory calculations that they are of importance only in a small number of particular cases.

Figure 27 – Figure 31 illustrate the C/S histograms for data at 20 MeV, and while in all cases the peak is reasonably sharp it should also be noted that in all cases the peak is centred above 1. This is particularly noticeable in the (n,t) and (n,n'p) reactions.

At this stage it is important to keep in mind that even if certain cross sections are known to high accuracy in a particular energy range then it is not uncommon to find that comparison of the data with either

evaluated files, experimental or systematic information at other energies can still generate significant discrepancies.

A comparison can be made at 14.5 MeV against  $(n,\gamma)$  systematics [37]. At this energy systematic formulae can be applied with some success, which is quite fortunate in view of the lack of information that exists in the experimental data base. Figure 26 clearly demonstrates that when a histogram of C/S values is plotted for all the 812  $(n,\gamma)$  total cross sections, 73% of the data are within the range 0.8 - 1.25. The second peak at around 2 to 3 on the abscissa, (~90 reactions), is however of more concern. These ratios typically originate from older evaluations, which are generally of reasonable quality, except in the pre-equilibrium range, where an approximate treatment was applied. Since  $(n,\gamma)$  cross sections around 14 MeV are not practically very important, the data have been retained for the current version. The small number of reactions with very small values of C/S are all for very low mass targets for which the systematics are not applicable.

## SACS validation

A novel method for validation of large size cross section libraries, called ‘Statistical analysis of cross sections’ (SACS), has been proposed and is described in reference 175. This method is based on the assumption that cross section excitation curves for all targets have a similar (bell) shape shifted by differences in  $Q$ -value, and that their properties, such as  $\sigma_{\max}$ ,  $E_{\max}$  and width at the half maximum  $\Delta_{1/2}$ , have a pronounced smooth trend as a function of  $A$  or the asymmetry  $s = (N-Z)/A$ . SACS has been implemented in SAFEPAQ-II [2] and was extensively tested on the libraries of data produced by the TALYS code [176,177], where it was demonstrated that this method is very useful for detecting data which have an incorrect format, unphysical values (especially  $\sigma_{\max}$ ) or incorrect excitation curve shapes. It was used in the production of EAF-2005.1 [8] where the errors found in EAF-2005 using this method were corrected.

SACS validation of all three parameters,  $\sigma_{\max}$ ,  $E_{\max}$  and  $\Delta_{1/2}$  has been applied as a very important validation tool during the assembling of EAF-2007 and results from this analysis resulted in a number of modifications. Some deficiencies in the TALYS calculated data sources have been found and corrected. The results for dominant major reaction channels with thresholds  $< 20$  MeV are presented here. In this report the majority of plots are of  $\sigma_{\max}(s)$  as these have proved to be the most important part of the SACS validation.

One important general observation should be mentioned here, namely that for particle emission channels many reactions have the maximum of the excitation curve close to or just above 20 MeV. This is demonstrated in Figure 32 for the  $(n,\alpha)$  reaction, where data with  $s > 0.15$  have  $E_{\max} > 20$  MeV. This fact was not fully appreciated in earlier evaluations and shows the importance of extending data up to 60 MeV for a full description of the excitation curve even for reactions with a threshold well below 20 MeV.

Data from EAF-2007 for the  $(n,2n)$  reaction are displayed in Figure 33. This shows a well defined trend, actually separate curves are given for points with and without experimental support, but they are almost identical except at low and high asymmetry. The fact that the two trend curves are similar is supporting evidence of the correctness of the Score = 0 data (see Table 12) in the library. The decrease of the  $\sigma_{\max}$  value at low asymmetry is largely due to competition with the  $(n,n'p)$  reaction. For targets with neutron separation energy ( $S_n$ )  $<$  proton separation energy ( $S_p$ ), it is found that the energy of the  $(n,n'p)$  threshold is less than the energy of the threshold of the  $(n,2n)$  reaction. To allow for this competition it is possible to display the sum of the  $(n,2n)$  and  $(n,n'p)$  cross sections, and this is shown in Figure 34. The summed reaction shows a smoother trend with less scatter, particularly for targets with  $s < 0.1$ .

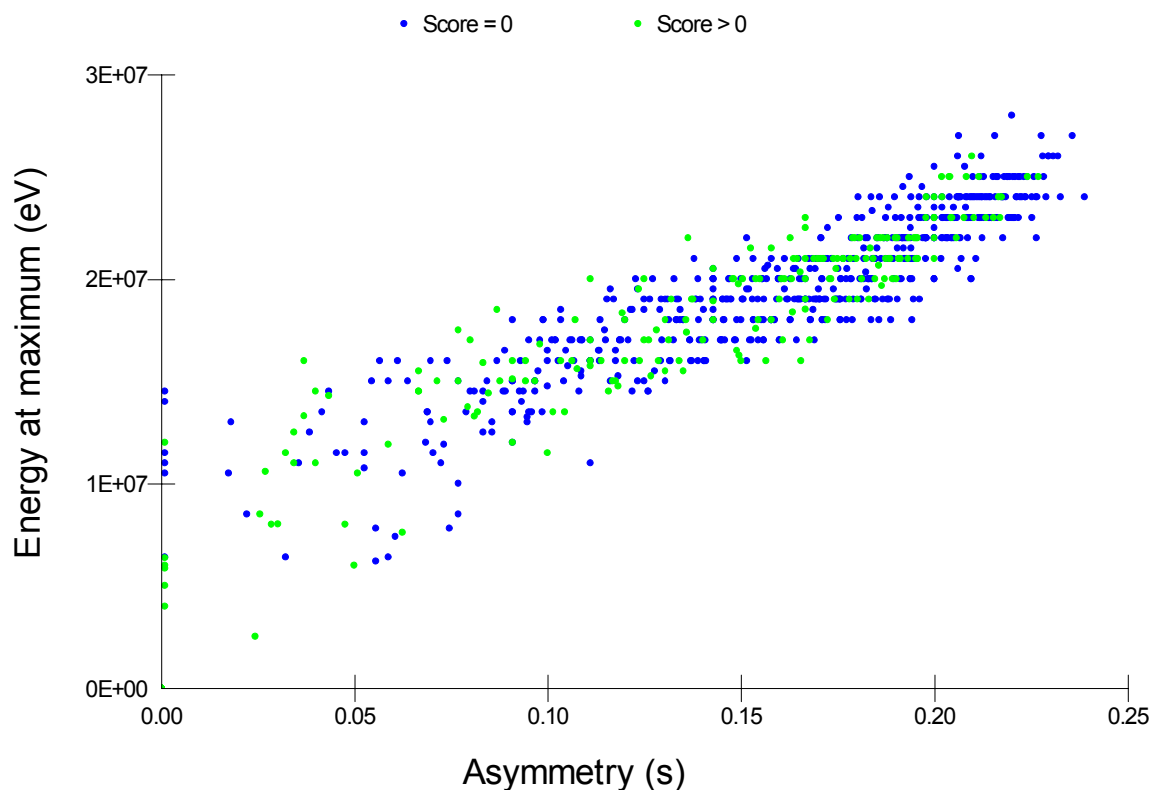

Figure 32.  $E_{\max}(s)$  plot for EAF-2007 (n, $\alpha$ ) data. Data for targets with  $A < 20$  have been excluded, and reactions with experimental support are plotted as green (light) points.

Figure 33.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,2n) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Reactions with experimental support are plotted as green (light) points. The trend curve cutting the y-axis at  $\sim 0.02$  b corresponds to points with Score = 0.

Figure 34.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,2n)+(n,n'p) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Reactions with experimental support are plotted as green (light) points. Note that the trend curves with and without data are almost identical.

Figure 35.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,3n) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Reactions with experimental support are plotted as green (light) points. Note that the trend curves with and without data are almost identical.

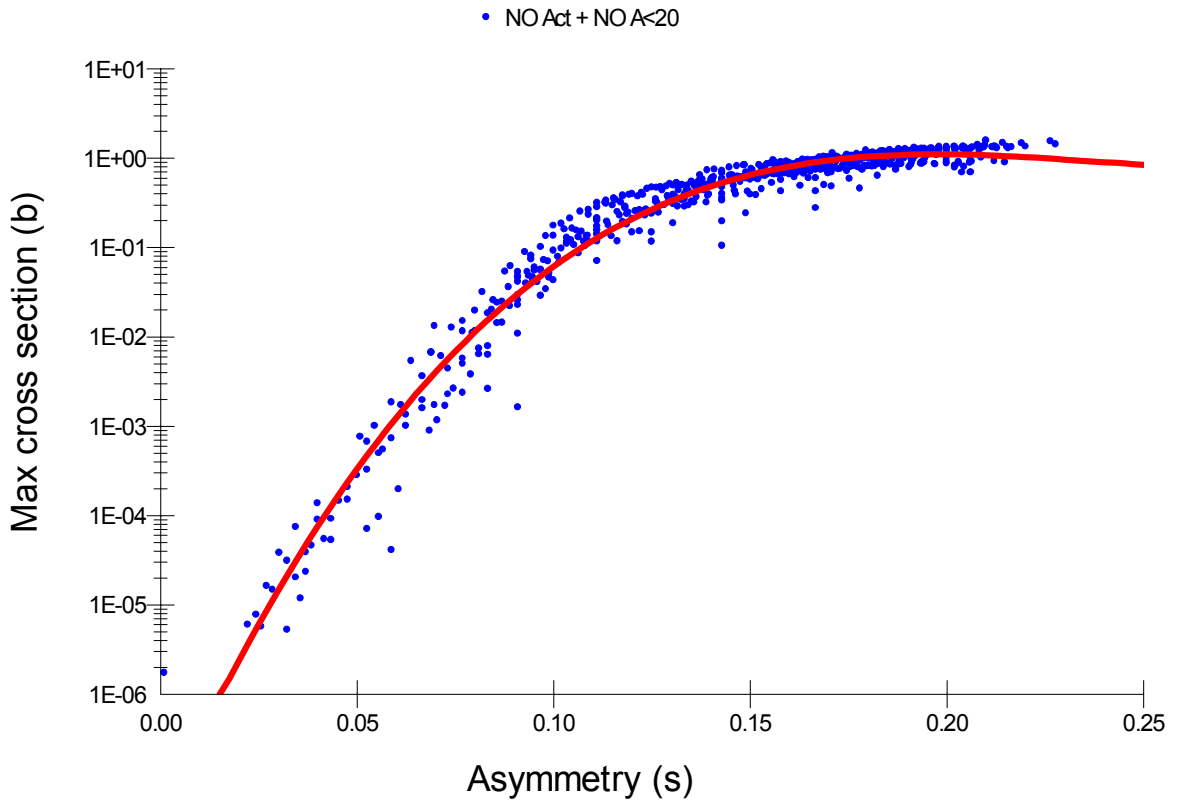

Figure 36.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,4n) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded.

Figure 37.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,n'p) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Reactions with experimental support are plotted as green (light) points. The trend curve cutting the y-axis at  $\sim 0.9$  b corresponds to points with Score = 0.

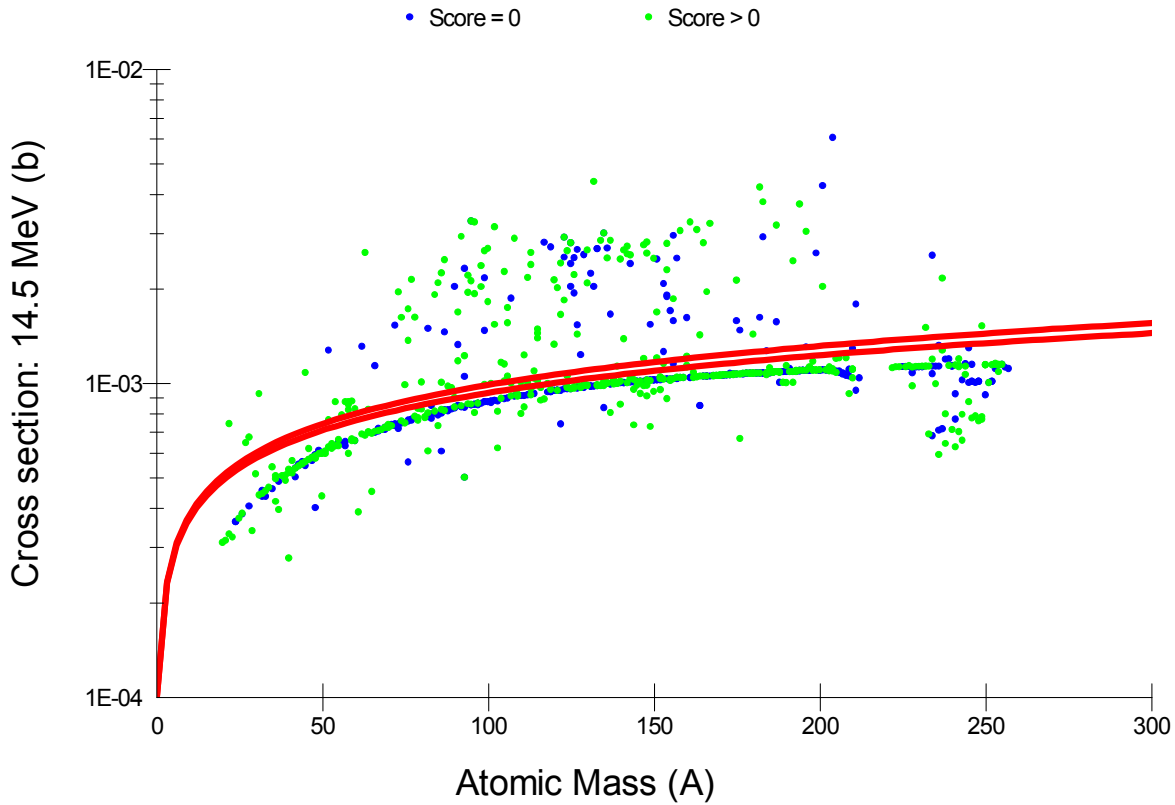

Figure 38.  $\sigma_{14.5}(A)$  for EAF-2007 (n, $\gamma$ ) data. Data for targets with  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points.

Figure 39.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,p) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points. The trend curve cutting the y-axis at  $\sim 0.6$  b corresponds to points with Score  $> 0$ .

Figure 40.  $\Delta_{1/2}(s)$  plot for EAF-2007 (n,p) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points.

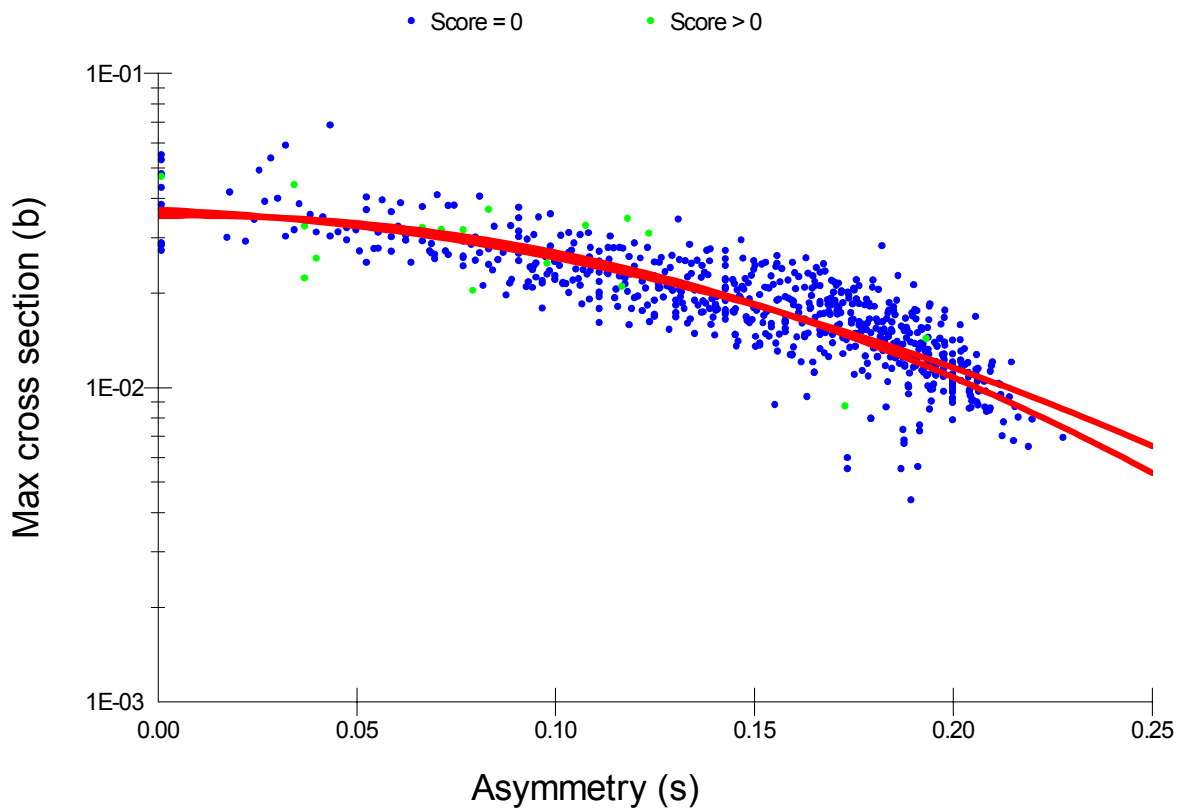

Figure 41.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,d) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points.

Figure 42.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,t) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points. The trend curve with the larger value at  $s = 0.1$  corresponds to points with Score = 0.

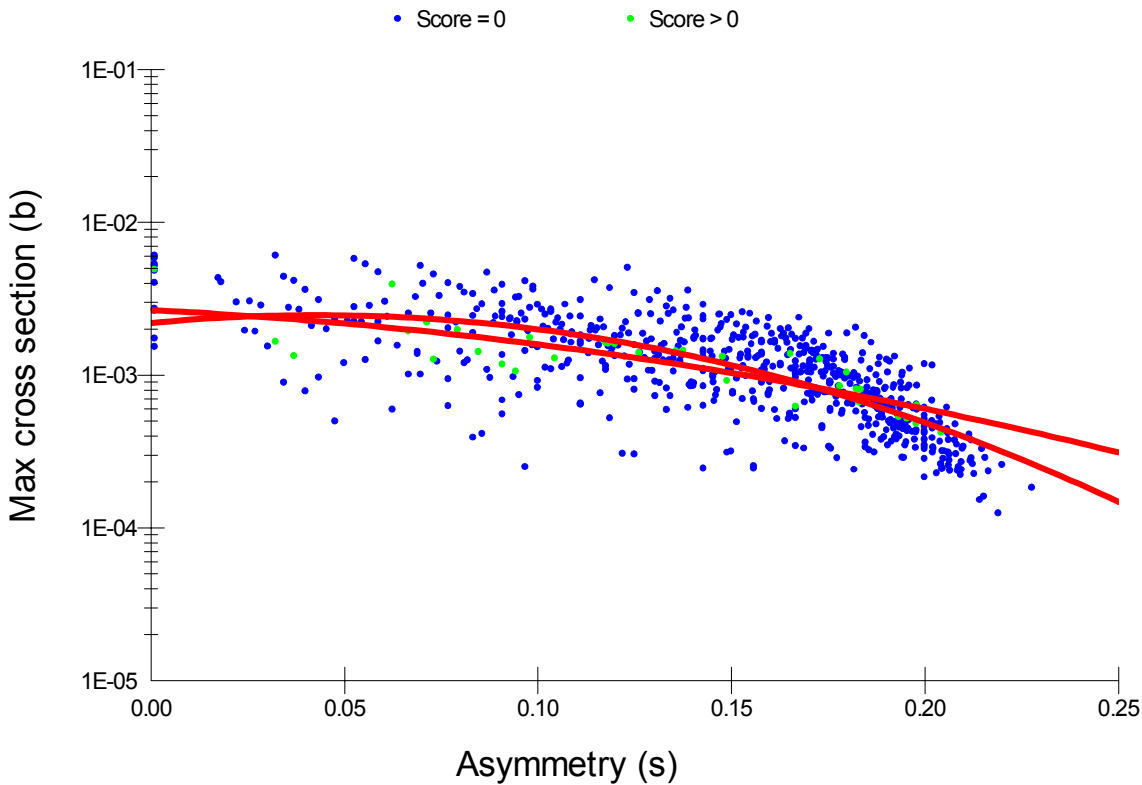

Figure 43.  $\sigma_{\max}(s)$  plot for EAF-2007 (n,h) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points. The trend curve with the larger value at  $s = 0.1$  corresponds to points with Score = 0.

Figure 44.  $\sigma_{\max}(s)$  plot for EAF-2007 (n, $\alpha$ ) data. Data for targets with  $Z > 85$  or  $A < 20$  have been excluded. Data with experimental support are plotted as green (light) points. The trend curve with the larger value at  $s = 0.25$  corresponds to points with Score = 0.

Data from EAF-2007 for the (n,3n) reaction are displayed in Figure 35, again the reactions with experimental data are indicated and the trend curves are similar. The EAF-2007 (n,4n) data are shown in Figure 36. For both reactions there is a well defined trend. Data from EAF-2007 for the (n,n'p) reaction are displayed in Figure 37, again the two trend curves correspond to reactions with and without experimental data, the difference between the curves is due to the large scatter of the experimental data. Enhanced (n,n'p) cross sections for targets with  $s < 0.1$ , corresponding to  $S_n < S_p$  can be seen in the figure.

Another option of the SACS analysis implemented in SAFEPAQ-II is used for the EAF-2007 (n, $\gamma$ ) data, namely plotting cross sections at a specific energy. Figure 38 shows data at 14.5 MeV, an important energy for the neutron-capture data, where the pre-equilibrium component (PEQ) dominates. A plot as a function of  $A$  is shown, because the pre-equilibrium component is closely related to the E1 Giant Resonance, the maximum of which smoothly decreases with energy as  $A$  increases causing a corresponding increasing trend with  $A$  in the 14.5 MeV PEQ value. Note that a reaction may have a Score  $> 0$  indicating that experimental data are available, but this may not be at 14.5 MeV, and indeed the set of points with a very well defined trend actually have been renormalized to the systematic value (see page 22). Values above the trend for a number of data points is

probably due to different code formalisms applied in the various data sources. However, values between 1 – 3 mb are physically acceptable. There are therefore a few reactions with values above this that may require additional study.

Data from EAF-2007 for the (n,p) reaction are displayed in Figure 39. A slight overestimation of  $\sigma_{\max}$  was observed in the analysis of the TALYS calculations and therefore renormalisation to systematics modification was used for many (n,p) reactions with no experimental data during library development. This ensured that the trend for reactions with Score = 0 is similar to the trend for reactions with experimental data. However, there still remains a significant overestimation for Score = 0 data for targets with small asymmetries.

An interesting and novel observation can be seen in the  $\Delta_{1/2}(s)$  plot for (n,p) reactions in Figure 40. Instead of a smooth curve, the trend has a well defined step at  $s \sim 0.1$ . This is caused by the competition of (n,n'p) reactions for targets with  $S_n < S_p$  (as is the case for (n,2n) data), this competition decreases the cross section available for the (n,p) reaction making the excitation curve narrower. A general conclusion can be drawn on the width of the (n,p) excitation curve, namely,  $\Delta_{1/2} = 10$  MeV for targets with  $s < 0.1$  and  $\Delta_{1/2} = 30$  MeV for targets with  $s > 0.1$ . The step also suggests that more care should be given to the calculation of targets in the transition region between these widths. It can be noted in Figure 40 that there is one point (at  $s = 0.21$ ) distinct from the trend. This corresponds to the  $^{194\text{m}}\text{Ir}$  target, which is an isomeric state with a high spin. Such targets present particular problems for model codes and this reaction will require additional study in the future.

Data from EAF-2007 for the (n,d) reaction are displayed in Figure 41, again there is a reasonably well defined trend and general agreement between the trend curves for reactions with and without experimental data. The discrepant point at  $s = 0.21$  corresponds to the  $^{194\text{m}}\text{Ir}$  target discussed above.

Data from EAF-2007 for the (n,t) reaction are displayed in Figure 42, again there is a reasonably well defined trend and general agreement between the trend curves for reactions with and without experimental data. The discrepant point at  $s = 0.21$  corresponds to the  $^{194\text{m}}\text{Ir}$  target discussed above.

Data from EAF-2007 for the (n,h) reaction are displayed in Figure 43, again there is a reasonably well defined trend and general agreement between the trend curves for reactions with and without experimental data. Note that as a result of integral data comparisons [128], where it was noted that the TALYS results were too small, all TALYS data have been increased by a factor of 4. The discrepant point at  $s = 0.21$  corresponds to the  $^{194\text{m}}\text{Ir}$  target discussed above.

Data from EAF-2007 for the (n, $\alpha$ ) reaction are displayed in Figure 44. A well defined smooth decreasing dependence of  $\sigma_{\max}$  on  $s$  can be seen. Both trend curves are almost identical, which demonstrates that the slight overestimate of the TALYS data has been corrected during library development. The increased spread of points at  $s \sim 0.2$  is probably due to the difficulty of accurately applying a renormalisation when the excitation curve is steeply rising. This general problem and possible improvements will be studied in future work.

For each of the reactions discussed above the equation of the trend curve (for all data points, with no distinction for Scores) has been derived and these are listed in Table 17. The spread of the points about the trend line can be made quantitative by considering confidence intervals. The factors required so that 68% and 99.5% of the points are covered are given in Table 18, and it can be seen that for all the reactions the factors are reasonably small. It is perhaps surprising that the reaction type with the largest factors is (n,p), which should be expected to be relatively easy to calculate. This indicates an area of work for future study.

Table 17. Equations of the trend curves  $\sigma_{\max}(s) = 10^{Z(s)}$  for various reactions.

Reaction	Z(s)
(n,2n)	$-1.7247 + 30.841s - 168.39s^2 + 325.50s^3$
(n,2n) + (n,n'p)	$-0.4657 + 6.4636s - 12.938s^2$
(n,3n)	$-4.1147 + 60.223s - 286.13s^2 + 461.97s^3$
(n,4n)	$-7.4294 + 98.967s - 427.26s^2 + 596.37s^3$
(n,n'p)	$-0.0955 - 8.1418s + 10.867s^2$
(n,p)	$0.0838 - 14.649s + 21.655s^2$
(n,d)	$-1.4342 - 0.5258s - 9.9392s^2$
(n,t)	$-2.3392 + 4.8423s - 22.252s^2$
(n,h)	$-2.6574 + 2.2812s - 27.644s^2$
(n, $\alpha$ )	$-0.2909 - 17.389s + 38.280s^2$

Table 18. Confidence intervals of points (the factor containing the given percentage) about the trend curve for various reactions.

Reaction	68%	99.5%
(n,2n)	1.19	1.58
(n,2n) + (n,n'p)	1.19	1.41
(n,3n)	1.19	2.24
(n,4n)	1.33	2.51
(n,n'p)	1.33	2.66
(n,p)	1.78	3.16
(n,d)	1.26	1.58
(n,t)	1.58	2.37
(n,h)	1.68	2.66
(n, $\alpha$ )	1.58	2.82

## EAF-2007 uncertainty file

A complete uncertainty file is generated by SAFEPAQ-II for the EAF-2007 cross section data library. The file is in the ENDF-6 MF = 33 format, and contains uncertainty data in a two-group format for threshold reactions from the threshold to 20 MeV and from 20 to 60 MeV. A four group format is adopted for the non-threshold reactions: from  $10^{-5}$  eV to  $E_V$  (the end of the  $1/v$  region),  $E_V$  to  $E_H$  (the end of the resonance region),  $E_H$  to 20 MeV and 20 to 60 MeV. The uncertainty values adopted correspond to the error factor  $f$ :

$$f = 1 + \Delta$$

where  $\Delta$  is the relative error ( $\Delta^2$  is actually stored in the file) in the cross section  $\sigma$ . In this case the best estimate of the cross section uncertainty is:

$$\sigma/f < \sigma < \sigma f$$

The emphasis for EAF-2007 uncertainties has been to include as much as possible of the experimental information. For threshold reactions experimental variance information at 14 MeV is available for 1,085 reactions. These uncertainties have been estimated from the data scatter around the library excitation curve in EXFOR plots or from the now growing data base of experimental validation [129-168]. This 14 MeV experimental variance is used for the energy range of the excitation function up to 20 MeV, and because no information on uncertainties at other energies has been used, an uncertainty value of  $\Delta\sigma = 3\Delta\sigma_{exp}$  has been adopted. This represents a 99.9% confidence limit. At present for the energy group above 20 MeV the same uncertainty used for the low-energy group has generally been adopted, however, this can be changed for particular reactions as required. For non-threshold reactions, thermal cross section and resonance integral information are used for the first two energy ranges. For the smooth statistical range the uncertainty factor is usually estimated from the scatter of EXFOR data around the evaluated curve. Again for the high-energy range the uncertainty value from the third range is generally assumed.

In the numerous cases where no experimental values are available, the uncertainty is extracted from systematics, results of graphical information or estimates (see Table 1). Depending on the reaction type, data origin and energy range the uncertainty value may vary from less than a few percent to a factor of five in exceptional cases. The bulk of the uncertainties however, range from a few percent to a factor of two.

Another important aspect of the uncertainty treatment occurs when the cross section is split. In general for uncertainties of cross sections

to ground and isomeric states an uncertainty factor of the branching ratio ( $f_b$ ) of 1.3 has been adopted when the branching is derived from systematics.

By definition  $\sigma_m = b\sigma$  and  $\sigma_g = (1-b)\sigma$ . Thus the uncertainty in  $\sigma_m$  is given by:

$$\left(\frac{\Delta\sigma_m}{\sigma_m}\right)^2 = \left(\frac{\Delta b}{b}\right)^2 + \left(\frac{\Delta\sigma}{\sigma}\right)^2$$

and  $\Delta\sigma/\sigma = f - 1$  and  $\Delta b/b = f_b - 1$ . Thus:

$$f_m = f_g = 1 + \sqrt{f_b^2 + f^2 - 2(f + f_b - 1)}$$

If experimental values of partial cross sections are known their uncertainties are adopted, although this is rare. Such a method of uncertainty propagation to the partial cross sections is certainly pessimistic although if no experimental data exist for the branching ratio their generation using systematics is not without error and an uncertainty of 30% is considered as sound pending further investigation.

An example of the EAF uncertainty file format is given in Appendix 1. Further details of the uncertainties and their use in FISPACT are presented in reference 1.

## EAF data formats

### *Point-wise data formats*

The format of the EAF-2007 file is essentially that of the MF = 3 file of ENDF-5 format with the following deviations (the resulting format is usually referred to as the EAF format):

- Two comment lines have been added at an earlier stage, stating the origin of data, the SAFEPAQ-II modifications and the Quality score.
- The material number MAT consists of  $Z$  and the two last digits of  $A$ . To describe isomeric targets  $A$  has been increased by 50 or 70 (m or n, respectively). Consequently, the order of the cross sections (according to increasing MAT numbers) is not always in accordance with increasing  $Z$  and  $A$ . This applies only to the point-wise format data, not to the multi-group constant library, for which another MAT number with more digits is used.
- The identifiers LIS and LFS are used to indicate the (isomeric) states of the target and final nucleus, respectively. Here we have adopted the convention that LFS = 99 means total production

cross section; LFS = 0, 1, or 2 means production of ground state, first and second isomeric state, respectively.

- The reaction nomenclature is as defined by ENDF, except that reaction numbers leading to isomeric states have been increased by 300 or 600 (for m and n, respectively). The cross sections for one material number are ordered according to increasing MT numbers, except that cross sections leading to isomeric states follow immediately after the cross section leading to the ground state.

The composition of the comment lines has been fully described in an earlier section. An example of the EAF point-wise file format is given in Appendix 2.

### **Group-wise data formats**

SAFEPAQ-II calculates the multi-group file using a procedure which is fully described in reference 2. The format of the multi-group library, GXS\_EAF, is the LIBOUT format of the code FOUR ACES (ENEA Bologna), again with two additional comment lines (modification data and Quality score are shown on the first, the second is blank) for each reaction. For reaction numbers the ENDF-reaction number MT multiplied by 10 has been adopted, with the convention that for the excitation of each isomeric state the reaction number is increased by one. The material numbers of EAF\_GXS consist of  $Z$ ,  $A$  and an identifier to indicate ground or isomeric target ( $MAT = Z \times 10000 + A \times 10 + LIS$ ). The order of the cross sections on the EAF\_GXS file is in accordance with increasing  $Z$ ,  $A$ , LIS, LFS and MT.

The multi-group file is produced in one of seven group-structures: that of GAM-2 (100 groups), VITAMIN-J (175 groups), WIMS (69 groups), XMAS (172 groups), VITAMIN-J+ (211 groups), TRIPOLI (315 groups) and TRIPOLI+ (351 groups) with appropriate flux-weighting spectra. However, if required the group structure could be changed into any other energy group structure or weighting function with a small amount of effort.

The accuracy of a set of multi-group constants is determined by the group structure and the weight function. This is particularly true when either the group structure is coarse (e.g. VITAMIN-J in the thermal range) or when the flux varies strongly between different regions of the device. Historically all of the weighting functions included a fission spectrum but that is not appropriate when the device is a fusion plant. Similarly having a fusion peak in the weight function used for a fission plant is not correct. Three distinct weight functions have been used to process the group-wise files. They are denoted as:

- FLA or FLT: a flat or constant weight function (not shown).

- FIS: this weight function combines a thermal Maxwellian at low energies, a  $1/E$  function at intermediate energies, and a fission spectrum ( $T = 1.3539$  MeV) with a fast dropping tail at higher energies shown in Figure 45.
- FUS: this weight function combines a thermal Maxwellian at low energies, a  $1/E$  function at intermediate energies, and a velocity exponential fusion peak spectrum with a peak at 14.07 MeV shown in Figure 46.

An example of the EAF group-wise file format is given in Appendix 3.

## Conclusions

The neutron-induced cross section data included in comprehensive activation files such as EAF-2007 come from sources having varying degrees of quality. The processing code SAFEPAQ-II enables all the necessary modifications to be performed in a well defined and quality assured manner. This leads to the creation of an activation file that can claim a much higher degree of quality than the original sources. The validation of the processed data, in various energy ranges, allows the correctness of the data treatments to be certified at the processing stage.

However, it is important to note that although the file is probably as complete as required for magnetic fusion applications, the experimental database that allows internal validation by C/E analysis is far from complete and contains many deficiencies. Although systematic comparisons can be made at high energies, the derived uncertainty margins are higher and rely more on estimation than on an experimental comparison. This introduces higher calculational uncertainties and so forces wider safety margins for applications that rely on 14 MeV data. A greater range of experimental measurements is therefore urgently required.

In EAF-2007 results of a wide range of integral experiments have been used to adjust data. Validation of activation code predictions, and thereby of cross section and decay data, has been performed by means of direct comparison with measurements of various materials under fusion-relevant neutron spectra. Integral experiments are a rich source of information with which a wide range of validation and comparison exercises can be made in the activation data field. The broad trends of the time dependent values of the calculated-to-experimental ratios represent the best estimates of the uncertainties that should be applied to predictions made with activation codes.

## **Acknowledgements**

The development of EAF and the production of this documentation have been supported by United Kingdom Engineering and Sciences Research Council and the European Communities under the contract of Association between EURATOM and UKAEA, and were carried out within the framework of the European Fusion Development Agreement. The views and opinions expressed herein do not necessarily reflect those of the European Commission.

Earlier EAF development at NRG Petten is recognised, and the authors would like to thank D Nierop for his many contributions. The authors acknowledge the support and dedication of many colleagues in the nuclear data community in the EU, RF, Japan and the USA without whom such work would have been impossible, in particular: P. Bém, A Filatenkov, M Herman, Y Ikeda, A Ignatjuk, AJ Koning, A Mengoni, F Maekawa, W Mannhart, U von Möllendorf, A Pashchenko, M Pillon, K Shibata, K Seidel, S Tagessen, H Vonach, H Weigmann, WB Wilson and K Zolotarjev.

## **Disclaimer**

Neither the authors nor UKAEA accept responsibility for consequences arising from any errors either in the present documentation or in the EAF libraries.

## **Contact person**

Feedback on the use of EAF is welcomed. Please contact R. A. Forrest with comments or in case of problems.

## Appendix 4: Index of EAF-2007 reactions

A listing of all 65,565 reactions in the EAF-2007 cross section library is given. Each reaction is shown with the initial (IS) and final (FS) isomeric states, the origin of the data (see Table 4), the Quality score (see Table 12), the types of modifications made (see reference 2) and the number of data points in the point-wise library. At the start of each reaction the symbol '>' indicates that the data have changed between EAF-2005 and EAF-2007 while '+' indicates that the reaction is new in EAF-2007. Note that two columns per page are presented, read each page from the bottom of column 1 to the start of column 2.
